

# Mike Girvin makes Array Formulas Fun!

This book systematically lists the aspects, elements and guidelines for array formulas. Array formulas can be insanely difficult. But there are times when an array formula is the only way to accomplish a task. Array formulas can beat filtering, sorting and pivot tables because array formulas will automatically update when the input cells change.

Why should you read this book:

- You love Excel magic and wizardry. Your idea of fun is making Excel do the impossible with a formula.
- You know how to create formulas and want to take the next leap in Excel, into the upper echelon of creating advanced formulas.
- You cringe when a co-worker sends a workbook with formulas wrapped in curly braces.
- You have heard about array formulas and know that in some situations, they are the most efficient solution, but you have no idea how to create them.
- You use array formulas and are aware of some of the drawbacks they present (such as slow formula calculation time), and you would like to learn how to create more efficient array formulas.
