Author Biographies	xix
Foreword	xxxi
Preface	xxxiii
International Cement Congresses	xxxv
Abbreviated Formulae	xxxvii
1. The History of Calcareous Cements	1
<i>Edwin A.R. Trout</i>	
1.1 Prehistory	1
1.2 The Classical World	2
1.3 The Middle Ages	3
1.4 The Augustan Age	4
1.5 John Smeaton, 1756	5
1.6 James Parker's Discovery of Roman Cement, 1796	6
1.7 French Investigation, 1805–13	8
1.8 Louis Joseph Vicat, 1812–18	9
1.9 Early Specifications for Artificial Cements, 1811–30	10
1.10 Aspdin's Patent for Portland Cement, 1824	12
1.11 The 'Proto-Portland' ERA, 1824–44	12
1.12 William Aspdin and 'Meso-Portland' Cements	13
1.13 Adoption of Portland Cement in Major Projects	16
1.14 Testing and Improvements in Quality Control	17
1.15 The Advent of 'Modern Portland' Cement, 1887–1904	19
1.16 Evolution of 'Modern Portland' Cements in the 20th Century	21
1.16.1 Strength	21
1.16.2 Soundness	21
1.16.3 Setting Times	22
1.17 Expansion of Manufacturing Output	22
1.18 Special Portland-Based Cements	22
1.19 Supplementary Cementitious Materials	23
1.20 Non-Portland Cements	24
1.21 The Scientific Study of Cements	24
1.21.1 Symposia on the Chemistry of Cement	26
1.21.2 Literature	26
1.22 Sources	27
References	27
2. Manufacture of Portland Cement	31
<i>Peter del Strother</i>	
2.1 Raw Materials for Clinker Manufacture	31
2.1.1 Chemical Targets for Raw Meal	31
2.1.2 Secondary Raw Materials	32
2.2 Recipe	32

2.3	Kiln Systems	32
2.3.1	Preparation of Feedstock and Grinding	32
2.3.2	Thermal Process: Meal Chemical Reactions	34
2.4	Clinker Minerals	36
2.5	Fuels and Combustion: Influences on the Manufacturing Process	39
2.5.1	Coal	39
2.5.2	Alternative Fuels	40
2.6	Environment: Emissions to Atmosphere of SO_3 , NO_x , VOC, CO, Dust, Hg, Cd and Tl	43
2.6.1	SO_3	43
2.6.2	NO_x	43
2.6.3	VOC and CO	43
2.6.4	Dust	43
2.6.5	Metallic Minerals	43
2.7	Circulation Phenomena and Bypass	44
2.7.1	Sulfur and Chloride Cycles	44
2.7.2	Potential to Control the Sulfur Cycle	48
2.8	Clinker Cooling	49
2.9	Mass and Heat Balance	50
2.10	Clinker Grinding	52
2.10.1	Ball Mills	52
2.10.2	Vertical Mills	52
2.10.3	The Performance of Ball Mill Relative to Vertical Mills	53
2.10.4	Particle Size Distribution	54
2.10.5	Characterisation of Separator Efficiency in a Ball Mill Circuit	54
2.10.6	Measurement of PSD	55
	References	55
3.	Components in Portland Cement Clinker and Their Phase Relationships	57
	<i>Duncan Herfort and Donald E. Macphee</i>	
3.1	Introduction	57
3.2	Phase Diagrams	57
3.2.1	Binary Diagrams and the Phase Rule	57
3.2.2	Ternary Diagrams	60
3.2.3	Isothermal Sections	62
3.2.4	Isoplethic Sections	63
3.2.5	General Rules for Interpreting Phase Diagrams	63
3.3	Oxide Components of Cements	64
3.3.1	Characteristics of Oxide Components	64
3.4	Cement-Related Systems	66
3.4.1	Systems Containing Major Components	66
3.4.2	Ternary Systems	70
3.4.3	Systems Containing Minor Components	75
	References	84
	Further Reading	86
4.	Constitution and Specification of Portland Cement	87
	<i>Arthur Michael Harrison</i>	
4.1	Introduction	87
4.2	Raw Materials	87
4.2.1	Primary Raw Material, Limestone	87
4.2.2	Secondary Raw Materials	89
4.2.3	Extraction of Raw Materials	93

4.3	Chemical and Mineralogical Composition of Clinker	94
4.3.1	Tricalcium Silicate (Alite)	95
4.3.2	Dicalcium Silicate (Belite)	97
4.3.3	Tricalcium Aluminate (Aluminate)	98
4.3.4	Aluminoferriite Phase (Ferriite)	100
4.4	Clinker Phases in Industrial Clinker	100
4.4.1	Compound Composition of Clinker	101
4.5	Burnability	102
4.6	Chief Chemical Parameters of Clinker	104
4.6.1	Lime Saturation Factor	104
4.6.2	Silica Ratio	105
4.6.3	Alumina to Iron Ratio	105
4.7	Effect of Raw Material Properties on Clinkering	106
4.7.1	Fly Ash as Raw Material for Clinker	107
4.7.2	Blastfurnace Slag as Raw Material for Clinker	108
4.8	The Clinkering Process	112
4.8.1	Transition to Clinker	112
4.9	Minor Constituents	115
4.9.1	Viscosity and Surface Tension of the Melt	115
4.9.2	Influence on Sintering	117
4.9.3	Distribution of Minor Catatonic Components in Clinker Phases	117
4.9.4	Magnesium Oxide	119
4.9.5	Alkalis and Sulfate	119
4.9.6	Fluorine	122
4.9.7	Boric Acid	125
4.10	Analysis of Clinker and Cement	125
4.10.1	Chemical and Mineralogical Analysis	125
4.10.2	Microscopy and Interpretation in Terms of Clinker Quality and Process Efficiency	127
4.10.3	Measurement of the Fineness of Cement	131
4.11	Effects of Milling	131
4.11.1	The Effects of Milling on Quality	132
4.12	Hydration of Portland Cement	134
4.12.1	Reactivity of the Clinker Phases	134
4.12.2	Pozzolanas and Latent Hydraulic Materials	137
4.12.3	Cement Hydration with Fly Ash and Blastfurnace Slag	142
4.13	Specification of Portland Cement	146
4.13.1	European Cement Standards	146
4.13.2	Australian Cement Standards	149
4.13.3	American Cement Standards	150
4.13.4	Comparison of Equivalent Cements	151
4.13.5	Other Cementitious Constituents	151
	References	152
	Further Reading	155
5.	Hydration, Setting and Hardening of Portland Cement	157
	<i>James Beaudoin and Ivan Odler</i>	
5.1	Introduction	157
5.1.1	General	157
5.1.2	Experimental Considerations	157
5.2	Hydration of Pure Clinker Minerals	159
5.2.1	Tricalcium Silicate	159
5.2.2	Dicalcium Silicate	172
5.2.3	Tricalcium Aluminate	176
5.2.4	Calcium Aluminoferriite	179

5.3	Interactions in the Hydration of Clinker Minerals	181
5.3.1	$\beta\text{C}_2\text{S}$ – C_3S System	181
5.3.2	C_3S – C_3A and C_3S – C_2 (A, F) Systems	181
5.4	Hydration of Portland Cement	181
5.4.1	Experimental Procedures	182
5.4.2	Mechanism of Cement Hydration: General	182
5.4.3	Mechanisms of Cement Hydration: Kinetics of the Hydration Process	183
5.4.4	Mechanisms of Cement Hydration: Composition of the Liquid Phase	185
5.4.5	Mechanisms of Cement Hydration: Heat of Hydration	186
5.4.6	Mechanisms of Cement Hydration: Experiments and Numerical Simulations	187
5.4.7	Mechanisms of Cement Hydration: Modelling and Simulation of Hydration Kinetics	189
5.4.8	Mechanisms of Cement Hydration: Molecular Modelling in Cement Science	191
5.4.9	Hydration of PC in Presence of Calcium Carbonate	194
5.5	Setting of Portland Cement	195
5.5.1	Setting: Definitions and Influencing Factors	195
5.5.2	Setting Mechanisms: Physicochemical Factors	197
5.5.3	Setting in Cement Pastes: Numerical Simulations	199
5.5.4	Detection of Setting in Hydrating Cement Paste	200
5.6	Hydrated PC Paste	204
5.6.1	Constituents of the Paste	204
5.6.2	Models of Cement Paste and C-S-H Nanostructure	205
5.6.3	Cement Paste Nanostructure	225
5.6.4	Cement Paste Microstructure	225
5.6.5	Pore Structure	229
5.6.6	Cement Paste Structure in the Vicinity of the Cement Paste–Aggregate Interface	231
5.7	Strength of Hydrated Cement	231
5.7.1	Mechanical Properties of Cement Systems	231
5.7.2	Strength of Hydrated Cement: Application of Taylor's Approach	239
5.7.3	Effect of Cement Composition on Strength	240
5.8	PC Hydration at Elevated Temperature	241
5.8.1	Hydration at 0–100°C	241
5.8.2	Hydration Above 100°C (High-Pressure Steam Curing)	242
	References	242
	Further Reading	250

6. Resistance of Concrete to Destructive Agencies 251

Sidney Mindess

6.1	Introduction	251
6.2	Permeability of Concrete	251
6.2.1	Absorption	252
6.2.2	Flow of Water Under Pressure	253
6.2.3	Gaseous Diffusion	253
6.2.4	Ionic Diffusion	253
6.2.5	Factors Affecting Permeability	254
6.3	Physical Attack	254
6.3.1	Freezing and Thawing	254
6.3.2	Fire Resistance	258
6.3.3	Crystallisation of Salts	261
6.3.4	Wear Resistance	261
6.3.5	Cracking	263
6.4	Chemical Attack	263
6.4.1	Efflorescence and Leaching	263
6.4.2	Sulfate Attack	265

6.4.3	Effect of Sea Water	268
6.4.4	Acid Attack	270
6.5	Corrosion of Metals in Concrete	272
6.5.1	Effect of Chloride Ions	274
6.5.2	Corrosion of Other Metals	276
6.5.3	Alkali-Aggregate Reactions	277
6.5.4	Electrolysis of Concrete	279
6.5.5	Action of Gases	279
6.6	Concluding Remarks	279
	References	280
	Further Reading	283
7.	Physicochemical and Mechanical Properties of Portland Cements	285
	<i>Kevin A. Paine</i>	
7.1	Introduction	285
7.2	Heat of Hydration	285
7.2.1	Heat of Solution	285
7.2.2	Isothermal Conduction Calorimetry	286
7.2.3	Adiabatic Calorimetry	289
7.2.4	Semi-Adiabatic Calorimetry	290
7.2.5	Effect of Proportion and Composition of Main Clinker Minerals	290
7.2.6	Effect of Sulfate Content	290
7.2.7	Effect of Alkali Content	291
7.2.8	Effect of Particle Size Distribution	292
7.2.9	Discussion	292
7.3	Setting Time	292
7.3.1	Effect of Proportion of Main Clinker Minerals	292
7.3.2	Effect of Sulfate Content	293
7.3.3	Effect of Alkali Content	293
7.3.4	Effect of Particle Size Distribution	294
7.3.5	Discussion	294
7.4	Strength	294
7.4.1	Strength of Concrete	295
7.4.2	Strength-Porosity Relationship for Cement Pastes	295
7.4.3	Concrete Cube Strengths	298
7.4.4	Mortar Prism Strengths	299
7.4.5	Influence of Cement Paste-Aggregate Interfaces	300
7.4.6	Effect of Proportion of Main Clinker Minerals	303
7.4.7	Effect of Initial Temperature Rise	307
7.4.8	Effect of Sulfate Content	310
7.4.9	Effect of Alkali Content	311
7.4.10	Influence of Clinker SO_3 , and Calcium Sulfate Additions	312
7.4.11	Effect of Minor Components	313
7.4.12	Effect of Specific Surface Area	313
7.4.13	Effect of Particle Size Distribution	314
7.4.14	Effect of Clinker Microstructure	315
7.4.15	Discussion	315
7.5	Instantaneous and Time-Dependent Strains Under Load	315
7.5.1	Constant Test Conditions	317
7.5.2	Stress History	317
7.5.3	Work on Cement Paste Specimens	317
7.5.4	Humidity at Test	318
7.5.5	Temperature at Test	319

7.5.6	Mix Parameters and Curing Conditions	319
7.5.7	Variable Test Conditions	319
7.5.8	Discussion	321
7.6	Drying Shrinkage	321
7.6.1	Cement Composition	322
7.6.2	Water/Cement Ratio or Paste Porosity	322
7.6.3	Curing Temperature	322
7.6.4	Admixtures	323
7.6.5	Specimen Geometry	323
7.6.6	Aggregate Restraint	323
7.6.7	Carbonation	323
7.6.8	Discussion	324
7.7	Durability	324
7.7.1	Microstructural Development	325
7.7.2	Permeation by Liquid Water	327
7.7.3	Permeability to Oxygen Gas	327
7.7.4	Oxygen Diffusion	328
7.7.5	Drying and Wetting	328
7.7.6	Ionic Diffusion	328
7.7.7	Cracking	329
7.7.8	Permeability of Cement Paste–Aggregate Interfaces	329
7.7.9	Freeze–Thaw Attack	330
7.7.10	Wear Resistance	331
7.7.11	Discussion	332
	References	332
8.	The Production of Low Energy Cements	341
	<i>Thomas Harrison, Martyn Roderick Jones and David Lawrence</i>	
8.1	Introduction	341
8.2	Approaches to Producing Low Energy Cements	342
8.3	Lowering the Energy Required in the Production of Portland Cement Clinker	342
8.4	Highly Reactive Portland Cement Clinkers	346
8.5	Belite Cements (C_2S Cements)	350
8.5.1	Active Belite Cements	352
8.6	Blended Cements Made by Diluting Clinker With Other Constituents	355
8.7	Low Energy Non-Portland Cements	356
8.7.1	Calcium Sulfoaluminate Cements	356
8.7.2	Alkali Activated Cementitious Materials (AACM)	357
8.7.3	Magnesium Oxide-Based Cements	357
8.7.4	Municipal Solid Waste Incinerator Ash Cements	358
8.8	Summary Points	358
	References	358
	Further Reading	361
9.	Pozzolanas and Pozzolanic Materials	363
	<i>Michael John McCarthy and Thomas Daniel Dyer</i>	
9.1	Introduction	363
9.2	Types of Pozzolanic Materials	363
9.2.1	Natural Pozzolanas	363
9.2.2	Artificial Pozzolanic Materials	369
9.3	Mixtures of Pozzolanic Materials With Lime	372
9.3.1	Pozzolanic Reaction	372

9.3.2	Thermal Treatment of Natural Pozzolanas	375
9.3.3	Reaction Products	376
9.3.4	Porosity and Microstructure	378
9.3.5	Strength of Mixes of Pozzolanic Materials and Lime	378
9.4	Cement Containing Pozzolanic Materials	381
9.4.1	Cement Types	381
9.4.2	Hydration of Clinker Phases With Pozzolanic Materials	383
9.4.3	Hydration of Cements Containing Pozzolanic Materials	390
9.4.4	Mass Transport Through Paste	409
9.5	Fresh and Mechanical Properties of Concrete	414
9.5.1	Workability and Bleeding	414
9.5.2	Compressive Strength	414
9.5.3	Tensile Strength	420
9.5.4	Modulus of Elasticity	420
9.5.5	Shrinkage and Creep	421
9.6	Transportation Properties of Concrete	423
9.7	Durability Properties of Concrete	426
9.7.1	Carbonation and Chloride-Induced Corrosion	426
9.7.2	Chemical Deterioration	431
9.7.3	Physical Deterioration	447
9.8	Concluding Remarks	449
	References	450
	Further Reading	467
10.	Cements Made From Blastfurnace Slag	469
	<i>Micheline Moranville-Regourd and Siham Kamali-Bernard</i>	
10.1	Processing of Blastfurnace Slag	469
10.2	Composition of Blastfurnace Slag	471
10.2.1	Chemical Composition of Blastfurnace Slag	471
10.2.2	Mineral Composition of Air-Cooled Slags	472
10.2.3	Constitution of Glassy Slags	472
10.2.4	Requirements	473
10.3	Slag Activation	474
10.3.1	Alkaline Activation: NaOH, KOH, Waterglass	475
10.3.2	Lime Activation: $\text{Ca}(\text{OH})_2$	476
10.3.3	Sulfate Activation: Gypsum, Hemihydrate, Anhydrite, Phosphogypsum	479
10.3.4	Combined Activation	480
10.3.5	Thermal Activation	483
10.4	Hydration Modelling of GGBS Cements	484
10.5	Hydraulic Activity of Slag	487
10.6	Portland Slag Cement and Blastfurnace Cement	489
10.6.1	Physical and Mechanical Properties	489
10.6.2	Estimation of Granulated Slag in Cement	495
10.6.3	Durability	496
10.6.4	Utilisations	498
10.7	Super-Sulfated Cement	499
10.7.1	Physical and Mechanical Properties	499
10.7.2	Durability	501
10.7.3	Utilisations	502
	References	502
	Further Reading	507

11. Microsilica as an Addition	509
<i>Robert Lewis and Per Fidjestøl</i>	
11.1 Introduction	509
11.2 The Material	509
11.2.1 Appearance	509
11.2.2 Physical Characteristics	509
11.2.3 Chemical Characteristics	509
11.2.4 Furnace Technology	510
11.3 Effects on Fresh Concrete	511
11.3.1 Mechanism	511
11.3.2 Workability	511
11.3.3 Stability	512
11.4 Setting and Hardening of Concrete	513
11.4.1 Mechanism	513
11.4.2 Heat of Hydration	513
11.5 Mechanical Properties of Hardened Concrete	513
11.5.1 Compressive Strength	513
11.5.2 Tensile and Flexural Strength	513
11.5.3 Brittleness and Young's Modulus	513
11.5.4 Bonding	514
11.5.5 Shrinkage	514
11.5.6 Creep	514
11.5.7 Fire Resistance	514
11.5.8 Abrasion and Erosion	515
11.5.9 Summary of Effects on Mechanical Properties	516
11.6 Durability of Hardened Concrete	517
11.6.1 General	517
11.6.2 Alkalinity of Microsilica Concrete	517
11.6.3 Porosity	518
11.6.4 Permeability	518
11.6.5 Sulfate Resistance	518
11.6.6 Carbonation	520
11.6.7 Chloride Resistance	520
11.6.8 Electrical Resistance	521
11.6.9 Leaching and Lime Bloom	521
11.6.10 Frost Resistance	522
11.6.11 Alkali Silica Reaction	522
11.6.12 Summary of Durability Properties	523
11.7 Practical Use of Microsilica in Concrete	523
11.7.1 Shotcrete	523
11.7.2 High-Strength Concrete	523
11.7.3 Specifying for Durability	524
11.8 Production of Microsilica	527
11.8.1 General	527
11.8.2 Characteristics	529
11.8.3 Available Forms of Microsilica	529
11.9 Health and Safety	530
11.10 Standards and Specifications	530
11.11 Mix Design Criteria	530
11.12 Other Mineral Additions and Calcium Aluminate Cements	531
11.13 Concluding Summary	531
References	532
Further Reading/Information Sources	535

12. Calcium Aluminate Cements	537
<i>Jason H. Ideker, Karen L. Scrivener, Hervé Fryda and Bruno Touzo</i>	
12.1 Introduction	537
12.2 Historical Note	537
12.3 Production and Mineralogy	538
12.3.1 A Wide Range of Compositions—Overview	538
12.3.2 Manufacture	538
12.3.3 Physical Characteristics of Calcium Aluminate Cements	540
12.3.4 Main Phases and Phase Equilibria Related to CACs	540
12.3.5 Mineralogy of CACs	543
12.3.6 Recent Developments	543
12.4 Hydration	545
12.4.1 Hydration of CAC with Water Alone	545
12.4.2 Supplementary Cementitious Materials (SCMs) and Fillers	548
12.4.3 Blends of CAC, PC and C\$	548
12.4.4 Intrinsic Properties Brought by Ettringite Formation	552
12.4.5 Some Formulation Guidelines	553
12.4.6 Impact of Admixtures and Organic Additives	554
12.4.7 Retarders	554
12.4.8 Acceleration	555
12.4.9 Water Reducers, Fluidifiers and Superplasticisers	556
12.4.10 Air Content Management	556
12.4.11 Thickener	556
12.4.12 Latex and Polymer Resins—Formulated Products	556
12.5 Applications	557
12.5.1 Building Chemistry	557
12.5.2 Flooring	557
12.5.3 Adhesive and Grouts	557
12.5.4 Technical Mortars	558
12.5.5 Priming and Finishing Walls and Facades	559
12.5.6 Rapid Repair/Construction	559
12.5.7 Abrasion Resistance	559
12.5.8 Heat-Resistant and Refractory Concretes	561
12.5.9 Heat-Resistant Concretes	561
12.5.10 Conventional Dense Refractory Castables	561
12.5.11 Insulating Concretes	562
12.5.12 Low-Cement Castables	562
12.5.13 Refractory Concretes for Reducing Atmospheres	563
12.5.14 Pipes and Wastewater	563
12.6 Strength and Conversion in CAC Concretes	563
12.6.1 Influence of Water to Cement Ratio on Conversion	564
12.6.2 Influence of Temperature on Kinetics of Conversion	565
12.6.3 Influence of Aggregate Mineralogy	567
12.6.4 Accelerated Conversion Testing	567
12.7 Durability	568
12.7.1 General Overview of CAC Durability	569
12.7.2 General Overview of Blended Systems (CAC + PC + C\$) Durability	569
12.7.3 Producing Durable Concrete	569
12.7.4 Corrosion of Steel	570
12.7.5 Corrosion of Steel Summary	573
12.7.6 Carbonation	573
12.7.7 Biogenic Deterioration	575
12.7.8 Sulfate Attack	575

12.7.9	Freeze–Thaw Attack	577
12.7.10	De-icing Chemicals	577
12.7.11	Alkali–Silica Reaction	577
12.7.12	Alkaline Hydrolysis—CAC	578
12.7.13	Volume Change	578
12.7.14	Thermal Properties	580
12.8	Conclusions	580
	References	581
	Further Reading	584

13. Special Cements

585

Martin Liska, Alexander Wilson and John Bensted

13.1	Introduction	585
13.2	Oil-Well Cements	585
13.2.1	General	585
13.2.2	Oil-Well Cement Standards	586
13.2.3	Standard Testing Procedures	588
13.2.4	Operating Conditions	592
13.2.5	Non-Standard Oil-Well Cements	593
13.2.6	Manufacture of Oil-Well Cements	594
13.2.7	Additives Used With Oil-Well Cements	596
13.2.8	Hydration of Oil-Well Cements	599
13.2.9	Effects of Aeration (Exposure)	603
13.2.10	General Considerations	604
13.3	Decorative Portland Cements	604
13.3.1	General Points	604
13.3.2	Manufacture of White Portland Cement	605
13.3.3	White Portland Cement Requirements	606
13.3.4	Hydration Chemistry of White Portland Cement	606

15. Concrete Aggregates	699
<i>Ian Sims, John Lay and James Ferrari</i>	
15.1 Introduction	699
15.2 Types and Sources of Natural Aggregates	699
15.2.1 Crushed Rock Aggregate in the United Kingdom	699
15.2.2 Natural Sand and Gravel in the United Kingdom	700
15.2.3 Aggregate Occurrence in Other Areas of the World	703
15.2.4 Source Variability	707
15.2.5 Manufactured and Recycled Aggregates	708
15.2.6 Service Record	709
15.3 Quarrying and Processing	710
15.3.1 Extraction Procedures	710
15.3.2 Selective Quarrying	711
15.3.3 'Super' Quarries	711
15.3.4 Processing of Aggregates	712
15.3.5 Transportation and Supply	714
15.4 Classification and Composition	714
15.4.1 Petrological and Mineralogical Terms	714
15.4.2 Petrographic Composition of Aggregates	716
15.4.3 Petrological Classification of Aggregates	717
15.4.4 Undesirable Constituents	719
15.5 Properties of Natural Aggregates	727
15.5.1 Particle-Size Distribution (Grading)	727
15.5.2 Fines (Clay, Silt and Dust) Content	729
15.5.3 Particle Shape and Particle Surface Texture	730
15.5.4 Particle Density	731
15.5.5 Porosity and Absorption	732
15.5.6 Bulk Density	733
15.5.7 Strength and Toughness	733
15.5.8 Hardness and Abrasion Resistance	734
15.5.9 Soundness and Physical Durability	736
15.5.10 Thermal Expansion and Conductivity	738
15.6 Influence of Aggregate on Concrete Properties	739
15.6.1 General Considerations	739
15.6.2 Workability of Fresh Concrete	739
15.6.3 Concrete Strength	740
15.6.4 Concrete Wear Resistance	744
15.6.5 Alkali-Aggregate Reactivity	745
15.6.6 Concrete Drying Shrinkage and Wetting Expansion	752
15.6.7 Concrete Freeze-Thaw Resistance	754
15.6.8 Chemical Resistance of Concrete	757
15.6.9 Concrete Resistance to Thermal Cycling and Fire	761
15.7 Manufactured Aggregates	762
15.7.1 Definitions	762
15.7.2 Lightweight Aggregates	762
15.7.3 Normal Weight Manufactured Aggregates	764
15.7.4 Heavyweight Aggregates	766
15.8 Recycled Aggregates	766
15.8.1 Definitions	766
15.8.2 Recycled Crushed Concrete Aggregate	767

16. Geopolymers and Other Alkali-Activated Materials	779
<i>John L. Provis and Jannie S.J. van Deventer</i>	
16.1 Alkali Activation: Introduction and Background	779
16.2 Classification of Alkali-Activated Binders	780
16.3 Low-Calcium Alkali-Activated Systems	780
16.3.1 Alkali Activation of Aluminosilicates	780
16.3.2 Binder Structure	782
16.3.3 Alternative Activators for Low-Ca Systems	785
16.3.4 Fly Ash Chemistry in Alkali-Activated Binders	785
16.3.5 Natural Mineral Resources as Precursors	787
16.4 High-Calcium Alkali-Activated Materials	788
16.4.1 Activators for BFS Systems	788
16.4.2 Binder Structure in High-calcium AAMs	789
16.4.3 Pore Solution Chemistry	789
16.4.4 Effects of BFS Characteristics	790
16.4.5 Non-Blastfurnace Slag Precursors	790
16.5 Intermediate Calcium Systems	792
16.5.1 Gel Coexistence in Blended Binders	792
16.5.2 Activators for Intermediate Ca Systems	793
16.5.3 Hybrid PC-Alkali-Aluminosilicate Binders	794
16.6 Admixtures in Alkali-Activated Binders	795
16.7 Performance, Durability and Open Questions	796

17. The Influence of the Water/Cement Ratio on the Sustainability of Concrete	807
<i>Pierre-Claude Aitcin</i>	
17.1 Introduction	807
17.2 Increasing the Design Strength of Concrete Structures to Decrease Their Carbon Footprint	807
17.3 The Water/Cement Ratio Law	808
17.3.1 The Water/Cement Ratio, an Indirect Measure of the Closeness of Cement Particles in a Cement Paste	808
17.3.2 Why Is It Possible to Produce Concretes Having at the Same Time a Very Low Water/Cement and a Very High Slump?	810
17.3.3 Why Concrete Strength Continues to Increase When There Is Not Enough Water to Fully Hydrate All Its Cement Particles?	810
17.3.4 Water/Cement Ratio and Water/Binder Ratio	811
17.3.5 Hydration of Blended Cement	812
17.3.6 Hydration of Cements Containing a Filler	813
17.3.7 Effect of the Water/Cement Ratio on the Microstructure of the Cement Paste	815
17.4 Sustainability of Concrete	816
17.4.1 Concrete Durability	816
17.4.2 Le Chatelier Experiment	816
17.4.3 Powers' Work on Hydration	818
17.4.4 Curing Low w/c Concrete	821
17.5 Back to the Future	824
17.6 Conclusion	824
