

Content

1.	Phenomenological Model of PEM Fuel Cell for Air Loop Design	14
2.	Possibilities of tribotechnical diagnostics for determination of engine oil degradation	28
3.	Assessment of real-world primary emissions of reactive nitrogen species from mobile sources using molecular spectroscopy in mid-infrared region	36
4.	Analytical Tool for the Identification of Vibration and Noise Sources in Turbochargers	46
5.	Combustion of Natural Gas in Engines for Heavy-Duty Vehicles	52
6.	New Method of Measuring Mechanical Losses by Motoring of Internal Combustion Engine	60
7.	Harmful emissions from a hybrid vehicle	70
8.	Parametric 3-D Model of ICE and Vehicle Power Trains for DASY	80
9.	Influence of Methane - free Synthesis Gases on Internal parameters of Combustion engine	92
10.	Combustion Engine Powered by Methane-free Synthesis Gases	102
11.	Hybrid Powertrain Optimization Tools	110
12.	Connection of a Two-cylinder Concept Engine for the Range Extender to the Dynamometer	130
13.	Cam design for variable valve lift system with switchable roller finger follower	138
14.	Simplified methodology of measurement with CTU tumble meter	150

15. Two-stage Turbocharged Large-Bore Gas SI ICE – Operation under Different NOx Level Conditions	158
16. Predicting Turbomachinery Performance by Detailed 3-D CFD Modelling	172
17. Dynamic Skipping of ICE Cycles - Advanced 1-D Simulation Model	186
18. Design Process of Divided Rocker Arms for Two-Stroke Engine Brake	200
19. Batteries used in electric vehicles and their impact on the environment	210
20. Parallel Plug-in HEV Topologies Evaluation Using Dynamic Programming	220
