## Preface

xiii

|                                                                      |    |
|----------------------------------------------------------------------|----|
| 1. Reconstructing History: Aims and Methodology                      | 1  |
| 1.1. Comparative Approaches Outside of Biology                       | 2  |
| 1.1.1. Stellar Evolution                                             | 2  |
| 1.1.2. The Periodic Table                                            | 4  |
| 1.1.3. Geological Strata                                             | 6  |
| 1.1.4. Plate Tectonics                                               | 7  |
| 1.2. The Comparative Method in Biology                               | 10 |
| 1.2.1. Scale of Nature versus Family Tree                            | 10 |
| 1.2.2. Reconstructing Phylogenies                                    | 14 |
| 1.2.2.1. <i>Phylogenetic Systematics</i>                             | 15 |
| 1.2.2.2. <i>Timetrees</i>                                            | 18 |
| 1.2.3. Character Reconstruction and Homology                         | 20 |
| 1.2.4. The Evolution of Development                                  | 23 |
| 1.2.5. Adaptation and Constraint                                     | 26 |
| 1.3. Comparative Approaches in Neurobiology                          | 30 |
| 1.3.1. Moving Past the Triune Brain Hypothesis                       | 30 |
| 1.3.2. Evo-Devo and the New Neuromorphology                          | 32 |
| 1.3.2.1. <i>The Field Homology Concept</i>                           | 34 |
| 1.3.3. Molecular and Cellular Homologies                             | 37 |
| 1.3.3.1. <i>Gene and Protein Evolution</i>                           | 38 |
| 1.3.3.2. <i>Evolution of Cell Types</i>                              | 38 |
| 1.3.4. Principles of Variation                                       | 41 |
| 1.4. The Importance of Natural History                               | 44 |
| References                                                           | 47 |
| 2. The Origin of Vertebrates: Invertebrate Chordates and Cyclostomes | 58 |
| 2.1. The Origins of Neurons and Nervous Systems                      | 58 |
| 2.2. Basal Vertebrates and Their Closest Invertebrate Relatives      | 61 |
| 2.2.1. Extant Basal Chordates                                        | 62 |
| 2.2.1.1. <i>Cephalochordates</i>                                     | 62 |
| 2.2.1.2. <i>Tunicates</i>                                            | 64 |
| 2.2.1.3. <i>Cyclostomes: Lampreys and Hagfishes</i>                  | 66 |
| 2.2.2. Extinct Basal Chordates                                       | 70 |
| 2.3. The Paleoeology of Early Chordates                              | 71 |
| 2.3.1. Continental Plates, Sea Levels, and Atmosphere                | 72 |
| 2.3.2. Species Diversity and Food Webs                               | 72 |
| 2.3.3. Threats, Constraints, and Opportunities                       | 75 |
| 2.4. The Major Sense Organs of Early Vertebrates                     | 78 |
| 2.4.1. Photoreception                                                | 78 |
| 2.4.2. Chemical Senses                                               | 82 |

|                                                             |     |
|-------------------------------------------------------------|-----|
| 2.4.3. Mechanosensory Hair Cells                            | 85  |
| 2.4.4. Electroreception                                     | 88  |
| 2.5. Movements and Motor Control                            | 90  |
| 2.6. Early Vertebrate Brains                                | 93  |
| 2.6.1. The Brains of Cyclostomes                            | 94  |
| 2.6.2. Invertebrate Chordate Brains                         | 99  |
| 2.6.2.1. <i>Amphioxus</i> Brains                            | 99  |
| 2.6.2.2. <i>Tunicate</i> Brains                             | 102 |
| 2.7. Developmental Mechanisms for Evolving a "New Head"     | 103 |
| 2.7.1. Placodes                                             | 104 |
| 2.7.2. Neural Crest                                         | 106 |
| 2.7.3. Developing a Telencephalon                           | 108 |
| 2.8. The Question of Novelty in Evolution                   | 110 |
| 2.8.1. Levels of Homology                                   | 111 |
| 2.8.2. Identifying Novelties                                | 113 |
| References                                                  | 115 |
| 3. The Origin of Jaws and Paired Fins: The Age of Fishes    | 125 |
| 3.1. Extant Jawed Fishes and Their Brains                   | 125 |
| 3.1.1. Cartilaginous Fishes                                 | 126 |
| 3.1.2. Ray-Finned Fishes                                    | 130 |
| 3.1.3. Lobe-Finned Fishes                                   | 135 |
| 3.2. The Paleoecology of Early Gnathostomes                 | 137 |
| 3.2.1. Stem Gnathostomes                                    | 137 |
| 3.2.2. The End-Devonian Mass Extinction                     | 141 |
| 3.3. The Sense Organs of Early Gnathostomes                 | 142 |
| 3.3.1. Photoreception                                       | 142 |
| 3.3.2. Chemical Senses                                      | 143 |
| 3.3.3. Vestibular Sensing                                   | 145 |
| 3.3.4. Hearing and Localizing Sounds                        | 146 |
| 3.3.5. The Lateral Line Systems                             | 147 |
| 3.3.5.1. <i>Mechanosensory Lateral Line</i>                 | 148 |
| 3.3.5.2. <i>Electrosensory Lateral Line</i>                 | 149 |
| 3.4. Gnathostome Movements and Motor Control                | 150 |
| 3.5. The Brains of Early Jawed Fishes                       | 154 |
| 3.5.1. Medulla                                              | 154 |
| 3.5.2. Cerebellum and Cerebellum-Like Structures            | 156 |
| 3.5.3. Midbrain Roof and Tegmentum                          | 160 |
| 3.5.4. Diencephalon                                         | 164 |
| 3.5.5. Hypothalamus                                         | 168 |
| 3.5.6. Telencephalon                                        | 171 |
| 3.5.6.1. <i>Evagination versus Eversion</i>                 | 171 |
| 3.5.6.2. <i>Pallial Homologies</i>                          | 173 |
| 3.6. Evolutionary Changes in Telencephalic Connections      | 178 |
| 3.6.1. Evolutionary Restriction of Olfactory Inputs         | 178 |
| 3.6.2. Functions of the Telencephalon in Early Gnathostomes | 180 |
| 3.7. Functional Synthesis                                   | 183 |
| References                                                  | 185 |

|                                                                  |     |
|------------------------------------------------------------------|-----|
| 4. The Invasion of Land: Lobe-Finned Fishes and Amphibians       | 196 |
| 4.1. The Lobe-Finned Vertebrates                                 | 196 |
| 4.1.1. Coelacanth                                                | 196 |
| 4.1.2. Lungfishes                                                | 198 |
| 4.1.3. Extant Amphibians                                         | 202 |
| 4.1.4. Extinct Tetrapods                                         | 205 |
| 4.2. Challenges and Opportunities on Land                        | 208 |
| 4.2.1. Air Breathing, Water Loss, and Gas Exchange               | 208 |
| 4.2.2. Moving on Land and Sensing in Air                         | 211 |
| 4.3. Sense Organs for Use on Land                                | 213 |
| 4.3.1. Terrestrial Vision                                        | 213 |
| 4.3.2. Hearing in Air                                            | 215 |
| 4.3.3. Losing the Lateral Line                                   | 218 |
| 4.3.4. Smelling on Land and in the Air                           | 219 |
| 4.4. Movement on Land                                            | 222 |
| 4.5. The Brains of Early Tetrapods                               | 226 |
| 4.5.1. Paedomorphosis and the Brain                              | 228 |
| 4.5.2. Medulla                                                   | 229 |
| 4.5.3. Cerebellum                                                | 231 |
| 4.5.4. Midbrain                                                  | 232 |
| 4.5.5. Diencephalon                                              | 234 |
| 4.5.6. Hypothalamus                                              | 236 |
| 4.5.7. The Telencephalon                                         | 238 |
| 4.5.7.1. <i>Subpallial Derivatives</i>                           | 239 |
| 4.5.7.2. <i>Divisions of the Pallium</i>                         | 243 |
| 4.6. Functional Organization of Early Tetrapod Brains            | 248 |
| References                                                       | 251 |
| 5. The Conquest of Land: Amniote Origins and the Age of Reptiles | 261 |
| 5.1. Early Amniotes and Extant Sauropsids                        | 261 |
| 5.1.1. The Tuatara, Lizards, and Snakes                          | 263 |
| 5.1.2. Turtles                                                   | 264 |
| 5.1.3. Crocodilians and Birds                                    | 268 |
| 5.1.4. Dinosaurs and Other Extinct Reptiles                      | 271 |
| 5.2. Ecological Challenges for Early Amniotes                    | 276 |
| 5.2.1. Water Loss and Gas Exchange                               | 276 |
| 5.2.2. Mass Extinctions and Recovery                             | 278 |
| 5.3. Enhanced Sense Organs                                       | 280 |
| 5.3.1. Vision, from Infrared to Ultraviolet                      | 281 |
| 5.3.1.1. <i>Cornea, Lens, and Papillary Cone</i>                 | 282 |
| 5.3.1.2. <i>Sophisticated Retinas</i>                            | 284 |
| 5.3.2. Tympanic Ears and High-Frequency Hearing                  | 286 |
| 5.3.3. Taste, Olfaction, and the Vomeronasal Sense               | 290 |
| 5.4. Changes in Motor Patterns and Control                       | 293 |
| 5.4.1. Locomotor Innovations                                     | 293 |
| 5.4.2. Necks, Jaws, and Catching Prey                            | 296 |
| 5.5. Changes in the Brains of Sauropsids                         | 297 |
| 5.5.1. Hindbrain Auditory Circuits                               | 297 |
| 5.5.2. Cerebellar Expansions and Novelties                       | 300 |
| 5.5.3. Midbrain Expansion and Complexity                         | 302 |

|                                                                         |     |
|-------------------------------------------------------------------------|-----|
| 5.5.4. A Large but Strange Forebrain                                    | 306 |
| 5.5.4.1. <i>Thalamus</i>                                                | 307 |
| 5.5.4.2. <i>Dorsal Ventricular Ridge</i>                                | 308 |
| 5.5.4.3. <i>Other Pallial Sectors</i>                                   | 315 |
| 5.6. Novel Forebrain Circuits and Functions                             | 318 |
| References                                                              | 323 |
| 6. The Rise of Endothermy: Mammals, but also Birds                      | 337 |
| 6.1. Extant Mammals                                                     | 337 |
| 6.2. Stem Mammals                                                       | 340 |
| 6.3. Synapsid Brain-Body Scaling                                        | 343 |
| 6.4. Paleocology, Physiology, and Behavior                              | 349 |
| 6.4.1. Becoming Small and Nocturnal                                     | 350 |
| 6.4.2. The Origins of Synapsid Endothermy                               | 351 |
| 6.4.3. Endothermy in Birds                                              | 355 |
| 6.4.4. Surviving an Asteroid                                            | 356 |
| 6.5. Modified Sensory Abilities                                         | 357 |
| 6.5.1. Vision                                                           | 357 |
