Pı	eface	7 Exercises	xi
		t you should be able to do after reading and working through this book	xi
		chapter titles	xii
	Addi	tional material for teaching and learning	xiii
Pa	rt 1:	Fundamentals	1
1	Ove	2. Atting a simple regression to take data. 3. Amerons conficients as confrantsons, not effects	3
	1.1	The three challenges of statistics	3
	1.2	Why learn regression?	4
	1.3	Some examples of regression	5
	1.4	Challenges in building, understanding, and interpreting regressions	9
	1.5	Classical and Bayesian inference	13
	1.6	Computing least squares and Bayesian regression	16
	1.7	Bibliographic note	17
	1.8	Exercises Control of the Control of	17
•	D-4-	The mutating comparisons as regression models	21
2		and measurement	21 21
	2.1	Examining where data come from	23
	2.2	Validity and reliability All graphs are comparisons	
	2.3		31
	2.4	Data and adjustment: trends in mortality rates Bibliographic note	33
	2.6	Exercises	34
	2.0	Excitises	34
3	Som	e basic methods in mathematics and probability	35
	3.1	Weighted averages	35
	3.2	Vectors and matrices	36
	3.3	Graphing a line	37
	3.4	Exponential and power-law growth and decline; logarithmic and log-log relationships	38
	3.5	Probability distributions	40
	3.6	Probability modeling	45
	3.7	Bibliographic note	47
	3.8	Exercises	47
4	Stati	stical inference	49
	4.1	Sampling distributions and generative models	49
	4.2	Estimates, standard errors, and confidence intervals	50
	4.3	Bias and unmodeled uncertainty	
	4.4	Statistical significance, hypothesis testing, and statistical errors	57
	4.5	Problems with the concept of statistical significance	60
	4.6	Example of hypothesis testing: 55,000 residents need your help!	
	4.7	Moving beyond hypothesis testing	66

4.9 Exercises 5 Simulation 5.1 Simulation of discrete probability models 5.2 Simulation of continuous and mixed discrete/continuous models 7.3 Summarizing a set of simulations using median and median absolute deviation 7.3 Summarizing a set of simulations using median and median absolute deviation 7.5 A Bootstrapping to simulate a sampling distribution 7.6 Fake-data simulation as a way of life 7.6 Bibliographic note 7.7 Exercises 7.6 Part 2: Linear regression 6 Background on regression modeling 8.1 Capture a simple regression to fake data 8.2 Fitting a simple regression to fake data 8.3 Interpret coefficients as comparisons, not effects 8.4 Historical origins of regression 8.5 The paradox of regression to the mean 8.6 Bibliographic note 8.7 Exercises 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 9.3 7.2 Checking the model-fitting procedure using fake-data simulation 9.7 7.3 Formulating comparisons as regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares, maximum likelihood, and Bayesian inference 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 9 Prediction and Bayesian inference 112 9 Prediction and Bayesian inference 113 9.1 Propagating uncertainty in inference using posterior simulations 113 9.2 Prediction and uncertainty: predict, posterior, linpred, and posterior_predict 115 9.4 Example of Bayesian inference 128 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 10.2 Interpreting regression coefficients 10.1 Adding predictors to a model 10.2 Interpreting regression coefficients 10.3 Interactions 10.4 Indicator variables 10.5 Formulating paired or blocked designs as a regression problem 109 109 100 100 101 102 103 104 105 105 105 105 106 107 108 109 109 109 109 109 109 109		4.8	Bibliographic note	67
5.1 Simulation of discrete probability models 5.2 Simulation of continuous and mixed discrete/continuous models 5.3 Summarizing a set of simulations using median and median absolute deviation 5.4 Bootstrapping to simulate a sampling distribution 5.5 Fake-data simulation as a way of life 6.6 Bibliographic note 7.7 Exercises 7.6 Background on regression modeling 6.1 Regression models 6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression to the mean 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 7.1 Example: predicting procedure using fake-data simulation 7.2 Checking the model-fitting procedure using fake-data simulation 7.3 Formulating comparisons as regression models 7.4 Bibliographic note 7.5 Exercises 7.6 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 8.2 Influence of individual points in a fitted regression 8.3 Least squares shope as a weighted average of slopes of pairs 8.4 Comparing two fitting functions: Im and stan_glm 8.5 Bibliographic note 9.1 Propagating uncertainty; predict, posterior_limpred, and posterior_predict 9.2 Prediction and Bayesian inference 9.3 Prior information and Bayesian synthesis 9.4 Example of Bayesian inference: beauty and sex ratio 9.5 Uniform, weakly informative, and informative priors in regression 9.7 Exercises 10.1 Linear regression with multiple predictors 10.2 Interpreting regression coefficients 10.3 Interpreting regression coefficients 10.4 Indicator variables		4.9	Exercises	67
5.2 Simulation of continuous and mixed discrete/continuous models 5.3 Summarizing a set of simulations using median and median absolute deviation 73 5.4 Bootstrapping to simulate a sampling distribution 75 5.5 Fake-data simulation as a way of life 76 5.6 Bibliographic note 77 78 79 79 70 70 70 70 70 70 70 70 70 70 70 70 70	5	Sim	ılation	69
5.3 Summarizing a set of simulations using median and median absolute deviation 5.4 Bootstrapping to simulate a sampling distribution 5.5 Fake-data simulation as a way of life 5.6 Bibliographic note 5.7 Exercises 76 Part 2: Linear regression 79 6 Background on regression modeling 6.1 Regression models 6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 9.3 The paradox of regression sa regression models 9.7 Exercises 9.7 Linear regression with a single predictor 7.3 Formulating comparisons as regression models 9.6 Bibliographic note 9.7 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 9. Prediction and Bayesian inference 9.1 Propagating uncertainty: predict, posterior_linpred, and posterior_predict 115 9. Prediction and uncertainty: predict, posterior_linpred, and posterior_predict 115 9. Prediction and inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 124 9.7 Exercises 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 111.2 Interactions 112.1 Interactions 113.1 Interactions 113.1 Interactions 113.1 Interactions 134.1 Indicator variables			Simulation of discrete probability models	69
5.4 Bootstrapping to simulate a sampling distribution 5.5 Fake-data simulation as a way of life 7.6 Bibliographic note 7.7 Exercises 7.6 Part 2: Linear regression 7.9 6 Background on regression modeling 6.1 Regression models 8.1 6.2 Fitting a simple regression to fake data 8.2 6.3 Interpret coefficients as comparisons, not effects 8.4 6.4 Historical origins of regression 8.5 The paradox of regression to the mean 8.6 Bibliographic note 9.7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 7.2 Checking the model-fitting procedure using fake-data simulation 9.7 A Bibliographic note 9.6 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 9.2 Influence of individual points in a fitted regression 8.2 Influence of individual points in a fitted regression 9.3 Least squares slope as a weighted average of slopes of pairs 9.4 Comparing two fitting functions: Im and stan_glm 9.5 Bibliographic note 9.6 Exercises 9.7 Prediction and Bayesian inference 9.8 Exercises 9.9 Prediction and Bayesian inference 9.1 Propagating uncertainty; predict, posterior_linpred, and posterior_predict 9.1 Propagating uncertainty; predict, posterior_linpred, and posterior_predict 9.2 Prediction and Bayesian synthesis 9.3 Prior information and Bayesian synthesis 9.4 Example of Bayesian inference: beauty and sex ratio 9.5 Uniform, weakly informative, and informative priors in regression 9.6 Bibliographic note 9.7 Exercises 10 Linear regression with multiple predictors 11 Interpreting regression coefficients 12 Linear regression with multiple predictors 13 Interpreting regression coefficients			Simulation of continuous and mixed discrete/continuous models	71
5.5 Fake-data simulation as a way of life 5.6 Bibliographic note 5.7 Exercises 76 5.7 Exercises 76 5.7 Exercises 76 5.7 Exercises 76 6 Background on regression modeling 6.1 Regression models 8.1 6.2 Fitting a simple regression to fake data 8.2 6.3 Interpret coefficients as comparisons, not effects 8.4 6.4 Historical origins of regression 8.5 6.5 The paradox of regression to the mean 8.6 Bibliographic note 8.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 93 7.2 Checking the model-fitting procedure using fake-data simulation 97 7.3 Formulating comparisons as regression models 99 7.4 Bibliographic note 90 8.5 Exercises 101 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares as weighted average of slopes of pairs 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 101 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 9.2 Prediction and Bayesian synthesis 9.4 Example of Bayesian inference: beauty and sex ratio 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 9.7 Exercises 10 Linear regression with multiple predictors 10 Linear regression with multiple predictors 11 Lot Adding predictors to a model 10.1 Indicator variables 10.3 Interactions 10.4 Indicator variables		5.3	Summarizing a set of simulations using median and median absolute deviation	73
5.6 Bibliographic note 5.7 Exercises 76 5.7 Exercises 76 Part 2: Linear regression 79 6 Background on regression modeling 6.1 Regression models 6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 93 7.2 Checking the model-fitting procedure using fake-data simulation 97 7.3 Formulating comparisons as regression models 99 7.4 Bibliographic note 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 113 9.2 Prediction and uncertainty: predict, posterior_linpred, and posterior_predict 115 9.3 Prior information and Bayesian synthesis 119 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 9.7 Exercises 128 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 10.2 Interpreting regression coefficients 130 10.3 Interactions 131 10.4 Indicator variables			Bootstrapping to simulate a sampling distribution	73
5.7 Exercises Part 2: Linear regression 6 Background on regression modeling 6.1 Regression models 6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 7.2 Checking the model-fitting procedure using fake-data simulation 97 7.3 Formulating comparisons as regression models 99 7.4 Bibliographic note 101 7.5 Exercises 101 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 8.3 Least squares slope as a weighted average of slopes of pairs 8.4 Comparing two fitting functions: Im and stan_glm 8.5 Bibliographic note 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 113 9.2 Prediction and uncertainty; predict, posterior_linpred, and posterior_predict 9.3 Prior information and Bayesian synthesis 119 9.4 Example of Bayesian inference: beauty and sex ratio 9.5 Uniform, weakly informative, and informative priors in regression 122 9.6 Bibliographic note 9.7 Exercises 110 Linear regression with multiple predictors 128 129.7 Exercises 128 140 Linear regression with multiple predictors 131 10.1 Adding predictors to a model 10.2 Interpreting regression coefficients 10.1 Indicator variables		5.5	Fake-data simulation as a way of life	76
Part 2: Linear regression modeling 6.1 Regression models 6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 7.2 Checking the model-fitting procedure using fake-data simulation 7.3 Formulating comparisons as regression models 9.4 Bibliographic note 101 7.5 Exercises 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 9.2 Prediction and duncertainty: predict, posterior_linpred, and posterior_predict 115 9.3 Prior information and Bayesian synthesis 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 122 9.6 Bibliographic note 128 9.7 Exercises 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 10.2 Interpreting regression coefficients 10.1 Indicator variables		5.6	Bibliographic note	76
6. Background on regression modeling 6.1 Regression models 6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 7.1 Example: predicting presidential vote share from the economy 7.2 Checking the model-fitting procedure using fake-data simulation 7.3 Formulating comparisons as regression models 9.7 A Bibliographic note 9.7 Bibliographic note 9.7 Exercises 9. Bibliographic note 9. Prediction and Bayesian inference 9. Bibliographic note 9. Prediction and Bayesian inference 9. Prediction and Bayesian inference 9. Bibliographic note 9. Example of Bayesian inference: beauty and sex ratio 121 9. Uniform, weakly informative, and informative priors in regression 123 9. Bibliographic note 9. Exercises 10 Linear regression with multiple predictors 11 Interpreting regression coefficients 12 Interpreting regression coefficients 13 Interpactions 13 Interpactions 134 10. Indicator variables		5.7	Exercises	76
6.1 Regression models 6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 93 7.2 Checking the model-fitting procedure using fake-data simulation 97 7.3 Formulating comparisons as regression models 99 7.4 Bibliographic note 101 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty: predict, posterior_limpred, and posterior_predict 9.2 Prediction and uncertainty: predict, posterior_limpred, and posterior_predict 9.3 Prior information and Bayesian synthesis 119 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 128 10 Linear regression with multiple predictors 10.1 Adding predictors to a model 10.2 Interpreting regression coefficients 10.3 Interactions 10.4 Indicator variables	Pa	rt 2:	Linear regression	79
6.2 Fitting a simple regression to fake data 6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 8.5 The paradox of regression to the mean 8.6 Bibliographic note 9.0 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 9.3 Formulating comparisons as regression models 9.7 Formulating comparisons as regression models 9.7 Formulating comparisons as regression models 9.7 Bibliographic note 9.8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty: predict, posterior_linpred, and posterior_predict 9.1 Propagating uncertainty: predict, posterior_linpred, and posterior_predict 115 9.3 Prior information and Bayesian synthesis 119 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 128 10 Linear regression with multiple predictors 10.1 Adding predictors to a model 10.2 Interpreting regression coefficients 10.3 Interactions 10.4 Indicator variables	6	Back	ground on regression modeling	81
6.3 Interpret coefficients as comparisons, not effects 6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 90 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 93 7.2 Checking the model-fitting procedure using fake-data simulation 97 7.3 Formulating comparisons as regression models 99 7.4 Bibliographic note 101 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 113 9.2 Prediction and uncertainty: predict, posterior_linpred, and posterior_predict 9.3 Prior information and Bayesian synthesis 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 128 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 111 10.2 Interpreting regression coefficients 10.3 Interactions 113 10.4 Indicator variables		6.1	Regression models	81
6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 93 7.2 Checking the model-fitting procedure using fake-data simulation 97 7.3 Formulating comparisons as regression models 99 7.4 Bibliographic note 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 9.1 Propagating uncertainty: predict, posterior_linpred, and posterior_predict 9.3 Prior information and Bayesian synthesis 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 128 10 Linear regression with multiple predictors 10.1 Adding predictors to a model 11.1 Interpreting regression coefficients 10.2 Interpreting regression coefficients 10.3 Interactions 10.4 Indicator variables		6.2	Fitting a simple regression to fake data	82
6.4 Historical origins of regression 6.5 The paradox of regression to the mean 6.6 Bibliographic note 90 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 93 7.2 Checking the model-fitting procedure using fake-data simulation 97 7.3 Formulating comparisons as regression models 99 7.4 Bibliographic note 101 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 113 9.2 Prediction and uncertainty: predict, posterior_linpred, and posterior_predict 9.3 Prior information and Bayesian synthesis 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 128 10 Linear regression with multiple predictors 120 121 122 123 134 10.1 Adding predictors to a model 135 10.2 Interpreting regression coefficients 10.3 Interactions 10.4 Indicator variables		6.3	Interpret coefficients as comparisons, not effects	84
6.6 Bibliographic note 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 9.3 7.2 Checking the model-fitting procedure using fake-data simulation 9.7 7.3 Formulating comparisons as regression models 9.9 7.4 Bibliographic note 101 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 113 9.2 Prediction and uncertainty: predict, posterior_linpred, and posterior_predict 115 9.3 Prior information and Bayesian synthesis 119 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 129 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 111 10.2 Interpreting regression coefficients 113 10.3 Interactions 1136		6.4		85
6.6 Bibliographic note 6.7 Exercises 91 7 Linear regression with a single predictor 7.1 Example: predicting presidential vote share from the economy 9.3 7.2 Checking the model-fitting procedure using fake-data simulation 9.7 7.3 Formulating comparisons as regression models 9.9 7.4 Bibliographic note 101 7.5 Exercises 101 8 Fitting regression models 8.1 Least squares, maximum likelihood, and Bayesian inference 103 8.2 Influence of individual points in a fitted regression 107 8.3 Least squares slope as a weighted average of slopes of pairs 108 8.4 Comparing two fitting functions: Im and stan_glm 109 8.5 Bibliographic note 111 8.6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 113 9.2 Prediction and uncertainty: predict, posterior_linpred, and posterior_predict 115 9.3 Prior information and Bayesian synthesis 119 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 129 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 111 10.2 Interpreting regression coefficients 113 10.3 Interactions 1136		6.5	The paradox of regression to the mean	87
7. Linear regression with a single predictor 7. 1 Example: predicting presidential vote share from the economy 7. 2 Checking the model-fitting procedure using fake-data simulation 93 7. 3 Formulating comparisons as regression models 99 7. 4 Bibliographic note 7. 5 Exercises 101 8 Fitting regression models 8. 1 Least squares, maximum likelihood, and Bayesian inference 103 8. 2 Influence of individual points in a fitted regression 107 8. 3 Least squares slope as a weighted average of slopes of pairs 108 8. 4 Comparing two fitting functions: Im and stan_glm 109 8. 5 Bibliographic note 111 8. 6 Exercises 111 9 Prediction and Bayesian inference 9.1 Propagating uncertainty in inference using posterior simulations 9.2 Prediction and uncertainty: predict, posterior_linpred, and posterior_predict 115 9.3 Prior information and Bayesian synthesis 119 9.4 Example of Bayesian inference: beauty and sex ratio 121 9.5 Uniform, weakly informative, and informative priors in regression 123 9.6 Bibliographic note 128 9.7 Exercises 128 10 Linear regression with multiple predictors 110.1 Adding predictors to a model 10.2 Interpreting regression coefficients 113 10.3 Interactions 1134 10.4 Indicator variables				90
7. /III	CONTENTS

15 Othe	er generalized linear models	263
	Definition and notation	263
15.2	Poisson and negative binomial regression	264
15.3	Logistic-binomial model	270
15.4	Probit regression: normally distributed latent data	272
15.5	Ordered and unordered categorical regression	273
15.6	Robust regression using the t model	278
15.7	Constructive choice models	279
15.8	Going beyond generalized linear models	283
15.9	Bibliographic note	286
15.10	D Exercises and a model in the control of the contr	286
Part 4:	Before and after fitting a regression	200
16 Desi	gn and sample size decisions	201
16.1	The problem with statistical power	291
16.2	General principles of design, as illustrated by estimates of proportions	293
16.3	Sample size and design calculations for continuous outcomes	297
16.4	Interactions are harder to estimate than main effects	301
16.5	Design calculations after the data have been collected	304
16.6	Design analysis using fake-data simulation	306
16.7	Ribliographic note	310
16.8	HEROENE HEROENE NO PROPERTY HEROENE	310
17 Posts	stratification and missing-data imputation	313
17.1	Poststratification: using regression to generalize to a new population	313
17.2	Fake-data simulation for regression and poststratification	320
17.3	Models for missingness	322
17.4	Simple approaches for handling missing data	324
17.5	Understanding multiple imputation	326
17.6	Nonignorable missing-data models	332
17.7	Bibliographic note	333
	Exercises	333
Part 5:	Causal inference	331
18 Caus	sal inference and randomized experiments	557
18.1	Basics of causal inference	557
18.2	Average causal effects	342
18.3	Randomized experiments	345
18.4	Sampling distributions, randomization distributions, and bias in estimation	346
18.5	Using additional information in experimental design	347
18.6	Properties, assumptions, and limitations of randomized experiments	350
18.7	Bibliographic note	355
18.8	Exercises	330
19 Caus	sal inference using regression on the treatment variable	
	Pre-treatment covariates, treatments, and potential outcomes	363
19.2	Example: the effect of showing children an educational television show	364
19.3	Including pre-treatment predictors	367
19.4	Varying treatment effects, interactions, and poststratification	370
19.5	Challenges of interpreting regression coefficients as treatment effects	373
106	Do not adjust for post-treatment variables	374

CO	NTE	NTS	IX
	19.7	Intermediate outcomes and causal paths	376
	19.8	Bibliographic note	
		Exercises	380
20	Ohee	ervational studies with all confounders assumed to be measured	383
20	20.1	The challenge of causal inference	383
	20.1	Using regression to estimate a causal effect from observational data	386
	20.2	Assumption of ignorable treatment assignment in an observational study	388
		Imbalance and lack of complete overlap	391
	20.5	Example: evaluating a child care program	394
	20.6	Subclassification and average treatment effects	397
	20.7	Propensity score matching for the child care example	399
	20.8	Restructuring to create balanced treatment and control groups	405
		Additional considerations with observational studies	413
) Bibliographic note	416
		Exercises	417
	20.1		
21	Addi	tional topics in causal inference	421
	21.1		421
	21.2	Instrumental variables in a regression framework	427
	21.3	Regression discontinuity: known assignment mechanism but no overlap	432
		Identification using variation within or between groups	440
	21.5	Causes of effects and effects of causes	445
	21.6	Bibliographic note	449
	21.7	Exercises	450
Pa	rt 6: '	What comes next?	455
22	Adva	anced regression and multilevel models	457
		Expressing the models so far in a common framework	457
		Incomplete data	458
	22.3		459
		Regularization for models with many predictors	459
		Multilevel or hierarchical models	460
	22.6		460
	22.7		464
		Computational efficiency	467
		Bibliographic note	471
) Exercises	471
Ap	pend	ixes	473
A	Com	puting in R	475
	A.1	Downloading and installing R and Stan	475
	A.1 A.2	Accessing data and code for the examples in the book	476
	A.3	The basics	476
	A.4	Reading, writing, and looking at data	481
	A.5	Making graphs	482
	A.6	Working with messy data	484
	A.7	Some R programming	488
	A.8	Working with rstanarm fit objects	490
