## INTRODUCTION

13

## LECTURE ONE

**Matter, Consciousness, Time and Space**

28

## LECTURE TWO

**Material Objects, Space and Time are Mere Illusions**

46

## LECTURE THREE

**Every Thought Has Its Physical Consequences –  
Not Only in Quantum Mechanics**

66

## LECTURE FOUR

**All of our mathematical and physical ideas and conclusions  
contain a potential error, which, in the form of a deviation  
from conceivable sameness, expresses the degree of mutual otherness  
of two observed quantities**

87

## LECTURE FIVE

**One of the greatest mysteries of consciousness is its ability to move in multiple directions in time, quite non-chaotically and systematically**

116

## LECTURE SIX

**The different perspectives of consciousness, intuition and mathematics on the same thing**

140

## LECTURE SEVEN

**We will arrive at an understanding of global creative intelligence only once we pass beyond the horizon and dissolution of physical and temporal limits...**

152

## LECTURE EIGHT

**Time is humanity's greatest mystery.**

**It seems to be a stable dynamic system that gives events their irreversible progress, but in reality is an unstable, relative and deceptive system, though one that allows movement to be expressed mathematically, and upon which we have built the foundations of physics.**

165

## LECTURE NINE

**Thought and consciousness are two different things**

233

## LECTURE TEN

**Thought is much faster than light, and can go everywhere it wants, with no collision. But its velocity cannot be calculated – here, mathematics lags behind physics, and physics lacks a toehold or some component it could grasp. Nevertheless, thinking is a process that does have its own speed, while consciousness is a state that needs no speed because it is present in all of objective reality.**

245

**Consciousness and Objective Reality**

259

**Conclusion**

292

**AFTERWORD**

295
