

CONTENTS

I. INTRODUCTION	5
II. DYNAMIC MODEL	7
II.1 Water tank model	8
II.2 Circulation water boiler	14
III. SIMULATION	20
III.1 Analog computer components and symbols	20
III.2 Time and amplitude scaling	24
III.3 Block for simulation with digital computer	26
III.4 Problem solving linear differential equations	28
III.4.1 Method reducing the order of derivation	28
III.4.2 Method of successivy integration	31
III.5 Function generating on the analog computer	33
IV. SYSTEM RESPONSE	35
IV.1 Standard test signals, time response for a general input	35
IV.2 Time response of first-order systems	41
IV.3 The transfer function	45
IV.4 Frequency response analysis	48
IV.4.1 Polar plots	48
IV.4.2 Bode plots	52
IV.5 Block diagram algebra	58
IV.6 The stability of linear systems	65
IV.6.1 Response terms contributed by varions types of roots.	65
IV.6.2 Algebraic criterions of stability	69
IV.7 Obtaining model's from experimenta data	73
V. FEEDBACK SYSTEM	76
V.1 Essential principles of feedback	77
V.2 Closed loop control system, elements and variables	79
V.3 Types of feedback	81
V.3.1 Two- and three - position feedback control	81
V.3.2 Continous feedback control	88
V.4 Stability region	92
V.5 Tuning of PID-controller	96
V.5.1 Manually tuning of PID-controller	96
V.5.2 Ziegler-Nichols tuning of PID-controller	100

VI. CONTROL SYSTEMS AND COMPONENTS	107
VI.1 Temperature measuring, transmitters and convertors	107
VI.2 Pneumatic control systems	112
VI.3 Eletronic control system	124
VI.3.1 Electronic two- and three - step action controllers .	125
VI.3.2 Electronic compact controller INTRON 66	128
APPENDICES	130
A1 Partial fraction expansion	130
A2 Laplace transform	135
A3 Table of Laplace transforms	142
Bibliography	143
Index	144
