Introduction	7
1 Basic considerations	13
1.1. Localization.....	14
1.2. External boundary conditions of localization	15
1.3. Homogenization	17
1.4. Localization using the BEM.....	17
1.5. Preliminary considerations on general interfaces	21
2 Fiber-matrix contact problem	24
2.1. The contact law.....	25
2.2. Formulation of the contact problem	27
2.3. Uzawa's algorithm	29
2.4. Example of debonding linear phases.....	33
2.5. Model with elasto-plastic matrix.....	38
2.6. Formulation of the problem of elasto-plastic matrix	39
2.7. Approximate solution of the problem of elasto-plastic matrix	44
2.8. Examples of the problem of elasto-plastic matrix.....	47
3 Homogenization	51
3.1. Model.....	51
3.2. Localization and homogenization - debonding interface	52
3.3. Formulation of the debonding problem	56
3.4. Example of debonding phases.....	58

3.5. Concluding notes	59
4 Application of extended Hashin Shtrikman principles for nonlinear materials	61
4.1. Basic formulas	62
4.2. Generalized Hashin Shtrikman principles	63
4.3. Variational bounds	66
4.4. Example of overall nonlinear properties using extended HS principles	69
4.5. Concluding remarks	73
5 Shape optimization of composites.....	75
5.1. Variational principles.....	75
5.2. Homogenization of periodic structures.....	76
5.3. Optimization.....	77
5.4. Euler's equations	79
5.5. Example of fiber shape optimization	80
5.6. Concluding remarks to shape optimization	81
6. Grain structure	83
6.1. Grain structure homogenization: PFC and Generalized PFC	83
6.2. Discrete Element Method - PFC	84
6.3. Model for averaging of material properties in PFC.....	86
6.4. Formulation of the problem	88
6.5. The contact laws	89
6.6. Boundary element solution	90
6.7. Results.....	92
7 Statical discrete elements	97
7.1. Multiphase composite with different ratio of material	97
7.2. Geometrical arrangement of the model	99
7.3. The contact laws	102
7.4. Governing equations.....	108
7.5. Interfacial conditions and the DSC.....	109
Conclusions	111
Example – Appendix	113
References.....	116
