Preface	6
THERMODYNAMICS	
1. What is thermodynamics about?	9
2. Basic terms and quantities	10
3. The kinetic theory of an ideal gas	15
4. The First Law of thermodynamics	17
5. Mathematics and thermodynamics – differentials; state quantities	18
6. The First Law of thermodynamics and heat; heat capacities, enthalpy	21
7. What is the first law of thermodynamics for?	22
8. Thermochemistry	24
9. Mathematics and thermodynamics – functional dependences, the difference between heat capacities	25
10. Reversible processes, equilibrium processes, irreversible processes	26
11. The Second Law of thermodynamics – introductory motivation	27
12. The Second Law of thermodynamics – continued: the Carnot cycle	28
13. The Second Law of thermodynamics – entropy	31
14. The Second Law of thermodynamics – interpretation and significance	34
15. Statistical interpretation of entropy	35
16. The Gibbs and Helmholtz energies	37
17. Combined formulations of the First and the Second law of thermodynamics	39
18. Criteria of equilibrium and spontaneity	40
19. Functional dependences of thermodynamic variables	41
20. Mathematics and thermodynamics – playing with derivatives	45
21. The difference between heat capacities	46
22. The Third Law of thermodynamics	47
23. The thermodynamic description of mixtures – principle	48
24. Thermodynamics of mixtures– thermodynamic quantities of mixtures	50
25. Thermodynamics of mixtures – partial molar quantities	51
26. Thermodynamics of mixtures – chemical potential, activity and fugacity	54
27. Phase behaviour and equilibrium – phase diagrams	57
28. Criteria for the phase equilibrium	60

29. The Gibbs phase rule	61
30. Reading the phase diagrams	62
31. Thermodynamics of solutions – the chemical potential	66
32. Thermodynamics of mixtures – activities in general	69
33. Thermodynamics of mixtures – standard states	71
34. Calculations of the phase diagrams	74
35. Thermodynamics of chemical equilibrium– the reaction isotherm	77
36. The significance of the reaction Gibbs energy	78
37. The effect of the temperature and pressure on the equilibrium constant	80

ELECTROCHEMISTRY

38. What is electrochemistry about?	83
39. Basics – electrolyte, electrolytic dissociation, electrolysis	83
40. The conduction of electric current by electrolytes – conductance, specific and molar conductivity	84
41. Strong and weak electrolytes, the Kohlrausch law	87
42. The dissociation constant of weak electrolytes	88
43. Activity coefficients of electrolyte solutions	90
44. The autodissociation (autoprotolysis) and the ionic product of water	91
45. Hydrolysis of salts	92
46. Transport of the current by electrolytes – ionic mobility	93
47. How the current is transported by electrolytes; transport numbers	95
48. The Debye-Hückel theory of ionic interactions	97
49. Electrochemical cells – basic terms; electrolysis	100
50. Electrochemical cells – the principle of their function	101
51. Electrochemical cells – the electromotive force	103
52. The Nernst equation	105
53. Standardization of electrode potentials	107
54. Thermodynamics and electrochemical cells	109
55. Electrochemical potential	110
56. Types of electrodes and cells	111
57. Diffusion potential for the cell with transference	112
58. Suppression of the diffusion potential, salt bridge	114
59. Use of the cells in chemistry	115
