<b>Preface</b>	9
<b>Introduction</b>	13
<b>1. Mathematical and quantum-mechanical background</b>	35
1.1. Some methods for regularizing divergent integrals	35
1.2. Padé approximants and their applications	40
1.2.1. Basic properties of the Padé approximants	41
1.2.2. Padé approximants of type II	47
1.2.3. Padé approximants of type III	49
1.2.4. Application of Padé approximants	50
1.3. Some methods of analytic continuation	58
1.3.1. Analytic continuation by means of power series	58
1.3.2. Analytic continuation by means of Padé approximants	61
1.3.3. Stability of analytic continuation	62
1.3.4. Analytic continuation of contour integrals	64
1.4. Scattering theory in a three-body system and the Faddeev integral equations	66
1.4.1. The features of the three-body problem as compared with the two-body problem	66
1.4.2. The Faddeev equations and their structure	68
1.5. The Hilbert-Schmidt method in the theory of integral equations	73
1.5.1. The Hilbert-Schmidt expansion for the Lippmann- Schwinger integral equation	77
1.5.2. The three-particle case	82
<b>2. General concepts of the theory of resonance states and processes</b>	88
2.1. Resonances in scattering theory	88
2.1.1. Parametrization of $S$ -matrix in and outside the vicinity of a resonance	89
2.1.2. Resonances without $S$ -matrix poles	99
2.1.3. Behaviour of scattering wave function near resonance	
2.2. Quasi-stationary (Gamow or Siegert) states	102
2.2.1. Relationships between the Gamow functions and the Green function	104

2.2.2. Normalization and orthogonality of the Gamow functions	110
2.2.3. Series expansions in terms of Gamow states	113
2.3. The Kapur-Peierls formalism and the basis of eigenfunctions for the operator Green function	117
2.4. Resonances in two-level system. A model example	122
2.5. Resonance states in the $R$ -matrix theory	127
<b>3. Theory of resonance states based on the Hilbert-Schmidt expansion</b>	<b>134</b>
3.1. Two-particle resonances	134
3.1.1. Perturbation theory for resonance states. Construction of normalized wave function	134
3.1.2. Determination of the Hilbert-Schmidt eigenvalues with the help of analytic continuation in energy	138
3.1.3. Calculation of the Hilbert-Schmidt eigenfunctions and eigenvalues by the method of continued fractions	142
3.2. Resonances in three-particle system	147
3.2.1. Three-particle Hilbert-Schmidt expansion and some classification of three-particle resonances	148
3.2.2. The method of analytic continuation in energy for the three-particle case	154
<b>4. Projection methods</b>	<b>159</b>
4.1. General projection formalism	159
4.2. Orthogonal projecting method	163
4.3. Analytic continuation of the scattering-theory equations	169
4.3.1. Continuation of the resolvent	170
4.3.2. Analytic continuation of the scattering-theory equations	172
4.3.3. Continuation of Faddeev equations	179
4.4. One-particle resonances	185
4.4.1. Equation for the resonance energy and width	185
4.4.2. Iterative inference of resonance parameters and decay amplitude	189
4.4.3. Examples	194
4.5. Resonances in three-particle system	196
4.6. Treatment of resonance states in the shell-model description of nuclear reactions	206
4.6.1. One-particle problem	208
4.6.2. Many-particle problem	211
4.7. Summary	216

<b>5. Theory of resonance states and processes based on analytical continuation in the coupling constant</b>	<b>219</b>
5.1. Two-particle resonances in real and complex potentials	220
5.1.1. Analytic properties of the energy eigenvalues as functions of the coupling constant	220
5.1.2. Analytic continuation in coupling constant and the determination of the parameters of the bound, resonance and antibound states	225
5.1.3. Determination of branch points	230
5.1.4. Wave functions of the Gamow states: orthogonality and normalization relations	232
5.1.5. Matrix elements comprising Gamow functions	235
5.1.6. Resonance in the complex potential	237
5.1.7. The resonance and near-threshold states in deformed potential	241
5.2. The structure of threshold singularities of energy eigenvalues in the presence of long-range interaction potentials	245
5.2.1. Coulombic case. Attraction	245
5.2.2. Coulombic case. Repulsion	251
5.2.3. Remarks	253
5.3. Many-particle resonance and near-threshold states in the systems with real potentials	254
5.3.1. Three-particle resonances with two-particle decay	256
5.3.2. Few-particle systems with potentials including strong repulsive core	257
5.4. Theory of quasi-stationary states with two particles in continuum	261
5.5. Scattering and the reactions involving unstable particles	264
5.5.1. Stripping to unbound state	265
5.5.2. Scattering of unstable particles by a target	268
5.6. Other examples of the application of the ACCC method in nuclear physics	270
<b>6. S-matrix parametrization of scattering data. Extraction of resonance parameters from experimental data</b>	<b>276</b>
6.1. Parametrization of single-channel S-matrix	278
6.1.1. The case of short-range interaction potential	279
6.1.2. Long-range forces	285
6.1.3. Polarization-type long-range interaction	291
6.2. Multichannel S-matrix parametrization	292

6.2.1. Complex phase-shift method	293
6.2.2. Multichannel $S$ -matrix	295
<b>7. Resonances in atomic physics</b>	302
7.1. Introduction	302
7.2. Methods for calculating the resonance states	305
7.3. Variational methods in the theory of resonances	307
7.4. Stabilization method	312
7.5. Complex scaling method	316
7.5.1. Analytic model	318
7.5.2. Computational aspect of complex scaling	322
7.5.3. The Stark effect	327
7.6. Post-collision interaction model	329
7.6.1. Optical-potential approach to the post collision interaction model	334
<b>Conclusion. Open problems</b>	341
<b>Appendix A</b>	344
<b>Index</b>	352
