

CONTENTS

1. SIGNALS AND SYSTEMS AND THEIR MATHEMATICAL MODELS	13
1.1 Complex numbers	13
1.2 Mathematical model of signals	13
1.3 Basic operations with continuous-time signals	14
1.4 Mean value	17
1.5 Effective value	19
1.6 Model of electrical system	21
2. PERIODIC SIGNALS AND THEIR SPECTRA	25
2.1 The Fourier series and its forms	25
3. FOURIER REPRESENTATION OF APERIODIC CONTINUOUS-TIME SIGNALS	31
3.1 The Fourier transform	31
3.2 Relationship between the Fourier series and the Fourier transform	33
4. CONTINUOUS-TIME SYSTEMS	35
4.1 Frequency response	35
4.2 Total response, ZIR and ZSR	39
4.3 Neural network as an example of nonlinear continuous-time system	42
5. SAMPLING OF CONTINUOUS-TIME SIGNALS	51
5.1 Ideal sampling	51
5.2 Sampling of band-limited signals	53
6. DISCRETE-TIME SIGNALS	55
6.1 One-dimensional (1D) discrete signals	55
6.2 Two-dimensional (2D) discrete signals	57
6.3 Addition and multiplication of discrete signals	60
6.4 Linear discrete convolution	60
6.5 Filtering of long 1D discrete signals	63
7. FOURIER REPRESENTATION OF DISCRETE SIGNALS	73
7.1 The discrete Fourier series	73
7.2 The discrete Fourier transform	75
7.3 The discrete cosine transform DCT-II	75
8. THE \mathcal{Z} TRANSFORM AND ITS PROPERTIES	83
8.1 The one-sided \mathcal{Z} transform	83
8.2 The inverse one-sided \mathcal{Z} transform	88
9. ONE-DIMENSIONAL SYSTEMS WITH DISCRETE TIME	93
9.1 Linear, time-invariant, and causal discrete systems	93
9.2 The system transfer function of linear, time-invariant (LTI) discrete systems	97
9.3 Frequency response of one-dimensional LTI discrete systems	101

9.4	Connection of partial sections of one-dimensional LTI discrete systems	110
10.	ANALYSIS OF ONE-DIMENSIONAL DISCRETE SYSTEMS	115
10.1	State-space matrix representation of one-dimensional LTI discrete systems	115
10.2	Mason's gain rule for the signal flow graph	119
10.3	Canonical structures of LTI discrete systems	120
10.4	Computer analysis of one-dimensional LTI discrete systems	121
10.5	Symbolic analysis of system transfer functions of one-dimensional LTI discrete systems	124
10.6	Semi-symbolic analysis of system transfer functions of one-dimensional LTI discrete systems	130
10.7	One-dimensional LTI discrete systems with minimum, mixed and maximum phase	132
10.8	All-pass digital filters	146
10.9	Causality check	150
11.	TWO-DIMENSIONAL DISCRETE SYSTEMS	153
11.1	Spatial frequency and discrete-spatial Fourier analysis	153
11.2	Linear shift invariant two-dimensional (LSI 2D) discrete systems	154
11.3	The 2D \mathcal{Z} transform	156
11.4	The 2D frequency response	157
11.5	Edge detection using Sobel's detectors	163
12.	MULTIRATE DIGITAL SIGNAL PROCESSING	169
12.1	Down-sampling of discrete signal in integer number ratio	169
12.2	Up-sampling of discrete signal in integer number ratio	176
12.3	Down-sampling and up-sampling of discrete signal in rational number ratio	177
13.	DISCRETE HILBERT TRANSFORM	179
13.1	Causal real discrete signal and its even and odd parts	179
13.2	Discrete-time Fourier transform of causal discrete signals	182
13.3	Discrete Hilbert transform of causal discrete signals	184
13.4	Discrete Fourier transform of periodically causal periodic discrete signals	185
13.5	Hilbert transformer	191
13.6	Design of Hilbert transformers	194
13.7	Representation of band-limited signals	196
14.	SHORT-TIME SPECTRAL ANALYSIS	199
14.1	Uncertainty principle	199
14.2	Short-time Fourier transform	199
14.3	Spectrogram	205
15.	DIGITAL FILTER BANKS	211
15.1	Two-channel quadrature mirror filter bank	211
15.2	Filter bank with perfect reconstruction	223
15.3	Perfect reconstruction two-channel FIR QMF bank	230
16.	WAVELET TRANSFORM AND FILTER BANKS	233
16.1	Octave filter bank	233
16.2	1D discrete-time wavelet transform	235
16.3	Scalogram	246
16.4	2D discrete-spatial wavelet transform	247
16.5	Multi-level resolution	250

17. LINEAR PREDICTION ANALYSIS	253
17.1 Crosscorrelation and autocorrelation sequences	253
17.2 Forward linear prediction and normal equations	256
17.3 Use of linear prediction to model the vocal tract	259
17.4 Lattice structure	261
17.5 Sample Pearson's correlation coefficient	264
18. HOMOMORPHIC SIGNAL PROCESSING	267
18.1 Homomorphic convolution, complex cepstrum.	267
18.2 Power cepstrum, real cepstrum, and phase cepstrum	270
18.3 Homomorphic deconvolution, exponential function	272
18.4 Homomorphic image processing	276
19. POWER SPECTRAL DENSITY.	281
19.1 Fourier analysis of stationary random signals	281
19.2 Periodogram	281
19.3 Periodogram averaging	284
19.4 Parametric methods for power spectral density estimation.	285
19.5 Relationships between the autocorrelation and the AR model parameters.	289
19.6 Yule-Walker method for power spectral density estimation	290
19.7 Burg method for power spectral density estimation.	290
20. HIGHER-ORDER SPECTRA	293
20.1 Power spectral density and higher-order spectra	293
20.2 Moments and cumulants.	293
20.3 Introduction to continuous-time higher-order spectra	294
20.4 Cumulants and high-order spectra (cumulant spectra).	297
20.5 Methods of bispectrum estimation	299
20.6 Detection of quadratic phase coupling.	301
20.7 Bicoherence	302
