PREFACE 10

a) Acknowledgements	10
b) Smidak Principles	10
c) A partial list of people who have commented on E.F.Smidak's works	12
d) Application of Smidak Principles to the creation of a textbook on Physics	13

INTRODUCTION I The Structure of Radiology 16

I.1. The Gradual Development of Radiology as a Clinical Discipline	16
I.2. Delimitation of Radiology as a Clinical Discipline	16
I.3. Components of the Study of Radiology	17
I.4. The Physics Component in the Study of Radiology	17
I.5. Approaches to Forming a Physics Component of the Profile of Graduates in Radiology	17

INTRODUCTION II The Structure of Physics 20

II.1. Classification of Physical Objects Depending on their Number and Size	20
II.2. Nature of Physical Objects	21
II.3. Development of Physical Objects up to the Present Time	24
II.4. States and Changes in States of Physical Objects	29
II.5. Particular Forms of Motion of Physical Objects	30
II.6. Subject of Investigation in Physics and Methods of Investigation	31
II.7. The Methods of Statistical Physics	33
II.8. The Methods of Non-Statistical Physics	34
II.9. A Model of the Structure of Physics	40

A. STATISTICAL PHYSICS 41

(Statistical approach to the investigation of physical objects and phenomena)

1. Choice of Statistical Assembly Type (Appendices A1,A2,A3)..... 41

1.1. Statistical and Non-Statistical Approaches in Physics	41
1.2. Thermodynamic State, and Thermodynamic Motion	43
1.3. Statistical Assembly of Macrosystems	45
1.3.1. Introduction of Statistical Assembly	
1.3.2. Independent and Identical Macrosystems as Elements of Statistical Assembly	
1.3.3. Microcanonic, Canonic and Grandcanonic Statistical Assemblies	
1.4. Tolman Hypothesis and Principal Characteristics of Thermodynamic States	47
SUMMARY I	49

2. Typology of Macrosystems (Appendices A1,A2,A3)	50
2.1. Statistical Assemblies Formed by Macrosystems of Free Particles	50
2.2. Macrosystems of Free Particles with Conservation of Discrete Energy Values	50
2.2.1. Maxwell-Boltzmann, Fermi, and Bose Gases	
2.2.2. Non-Degenerate and Degenerate Fermi and Bose Gases	
2.3. Macrosystems of Free Particles with Conservation of Indistinguishableness of Particles.....	52
2.3.1. Macrosystems of Classical and Quantum Particles	
2.3.2. Quantum Statistical Approach	
2.3.3. Classical Statistical Approach	
SUMMARY 2	55
3. Quasi-Classical Statistical Approach (Appendices A1,A2,A3)	56
3.1. Relativistic Statistical Approach to Macrosystem of Free Particles	56
3.2. Weighted Factor of Energy Level and Difference Between Macrosystems of Distinguishable and Indistinguishable Particles	57
3.2.1. Weighted Factor of Energy Level	
3.2.2. Factor of Energy Level Degeneration	
3.2.3. Determination of Weighted Factor for Simple Cases	
3.2.4. Difference between Distinguishable and Indistinguishable Particles	
3.3. Weighted Factor of Thermodynamic State and Entropy as a Measure of Macrosystem Disorder	60
3.3.1. Entropy in Phenomenological Thermodynamics	
3.3.2. Relationship between Entropy and Weighted Factor of a Thermodynamic State	
3.3.3. Entropy in Statistical Thermodynamics	
3.3.4. Derivation of Boltzmann Equation	
3.4. Principle of the Quasi-Classical Statistical Approach	64
3.4.1. Combination of Classical and Quantum Assumptions	
3.4.2. General Determination of Number of Quasi-Classical States	
3.4.3. Determination of Number of Quasi-Classical States in Energy Layers	
3.4.4. Relation between Number of Quasi-Classical States and Weighted Factor	
3.4.5. Quasi-Classical Distribution Function and Its Values	
3.4.6. Outline of Algorithm of Quasi-Classical Statistical Approach	
SUMMARY 3	68
4. Thermodynamic Functions of Macrosystem (Appendices A1,A4,A5)	69
4.1. Classification of Thermodynamic Functions	69
4.2. Thermodynamic Postulates	69
4.3. Laws of Thermodynamics	71
4.4. Outline of Thermodynamic Potentials	73
4.4.1. Introduction of Thermodynamic Potential Concept	
4.4.2. Introduction of Internal Energy	
4.4.3. Introduction of Free Energy	
4.4.4. Introduction of Enthalpy	
4.4.5. Introduction of Gibbs Potential	
4.4.6. Introduction of Chemical Potential	
4.4.7. Introduction of Grandcanonic Potential	
4.4.8. Reasons for Introducing Thermodynamic Potentials	
SUMMARY 4	79
5. Methods of Examining Macrosystems (Appendices A1,A4,A5)	80
5.1. Method Based on Grandcanonic Statistical Assembly	80
5.1.1. Quantum Distribution Function, Grand State Sum, Mean Values in Assembly	

5.1.2. Fermi-Dirac Distribution	
5.1.3. Bose-Einstein Distribution	
5.1.4. Maxwell-Boltzmann Distribution	
5.1.5. Utilization of Quasi-Classical Statistical Approach	
5.1.6. Algorithm of Method	
5.2. Method Based on Canonic Statistical Assembly	86
5.2.1. Quantum Distribution Function, Small State Sum, Mean Values in Assembly	
5.2.2. Quasi-Classical Adjustment of Small State Sum for a Particle	
5.2.3. Quasi-Classical Adjustment of Translational State Sum for a Particle	
5.2.4. Quasi-Classical Adjustment of Structural State Sum for a Particle	
5.2.5. Algorithm of Method	
SUMMARY 5	90
6. Illustrations of Particular Macrosystems (Appendices A1,A4,A5)	91
6.1. Radiation of Black Body	91
6.2. Crystal Lattice Oscillations	94
6.3. Statistical Meaning of Law of Ideal Gas	96
SUMMARY 6	98

SET OF APPENDICES A

A Model of the Structure of Statistical Physics	99
APPENDIX A1 Composition of the Model	99
APPENDIX A2 Representation of the Model of the Structure of Chapters 1, 2, and 3 ..	100
APPENDIX A3 Description of the Model of the Structure of Chapters 1, 2, and 3	101
APPENDIX A4 Representation of the Model of the Structure of Chapters 4, 5, and 6 ..	102
APPENDIX A5 Description of the Model of the Structure of Chapters 4, 5, and 6	103

B. NON-STATISTICAL PHYSICS

(Non-statistical approach to the investigation of physical objects and phenomena)

7. Classical Mechanics (Appendices B1,B2,B3,B8)	104
7.1. Delimitation of Classical Mechanics	104
7.2. Formalisms of Classical Mechanics	106
7.2.1. Sequence of Steps of Lagrangian and Hamiltonian Formalisms	
7.2.2. Illustration of the Steps of Lagrangian and Hamiltonian Formalisms	
7.3. Laws of Conservation as Integrals of Motional Equations	109
7.3.1. Law of Mechanical Energy Conservation	
7.3.2. Further Laws of Conservation, Number of Motional Equations Integrals	
7.4. Mechanical Oscillating Motion of Oscillator	111
7.4.1. General and Periodic Oscillating Motion	
7.4.2. Uniform Circular Motion, Harmonic Oscillating Motion	
7.4.3. Dynamic and Kinematic Description of Harmonic Oscillating Motion	
7.4.4. Compounding of Harmonic Oscillations	
7.4.5. Damped and Forced Oscillating Motion	
7.5. Mechanical Wave Motion	117
7.5.1. Types of Wave Motion, Interference of Wave Motion, Wave Length	
7.5.2. Kinematic and Dynamic Description of Mechanical Wave Motions	
7.5.3. Sound, Ultrasound	
7.6. Continuum Mechanics	121
7.6.1. Subject of Investigation of Continuum Mechanics	
7.6.2. Delimitation of Continuum Models	

- 7.6.3. Use of Continuum Models
- 7.6.4. Main Method of Investigating Motional States of Continuum
- 7.6.5. Illustration of Main Method

8. Classical Applications of Electromagnetic Field (Appendices

B1,B2,B3,B8)	130
8.1. Electromagnetic Field as a Classically and Non-Statistically Considered Physical Object	130
8.2. Lagrangian and Hamiltonian Formalisms for Electromagnetic Field	132
8.3. Motion of Classical Charge in Constant Electromagnetic Field	133
8.3.1. Lagrange Equations of Charge	
8.3.2. Transverse and Longitudinal Homogeneous Electric Field	
8.3.3. Homogeneous Magnetic Field	
8.4. Maxwell Equations of Electromagnetic Field	136
8.4.1. Maxwell Theory of Electromagnetic Field, Field Sources and Vortices	
8.4.2. Mathematic Description of Sources and Vortices and Their Choice	
8.4.3. Formulation of a System of Maxwell Equations	
8.4.4. Consequences of Maxwell Equations	
8.5. Electromagnetic Wave Motion	142
8.5.1. Maxwell Equations for Free Electromagnetic Field	
8.5.2. Monochromatic Electromagnetic Wave	

9. Quantum Mechanics (Appendices B1,B4,B5,B8).....

9.1. Postulate Structure of Quantum Mechanics	146
9.1.1. Dirac Principle of Absolute Smallness	146
9.1.2. Correspondence Principle	
9.1.3. Complementarity Principle, and the Uncertainty Principle	
9.1.4. Interpreting Postulates; Principle of Superposition	
9.1.5. Schrödinger Equation, and Description of Mathematical Model of Quantum Mechanics	
9.2. Main Method of Quantum Mechanics for Stationary States	156
9.3. Application of Main Method - Hydrogen Atom	157
9.3.1. Physical Definition of Problem, Determination of Initial Conditions	
9.3.2. Definition of Complete Set of Operators and Quantities	
9.3.3. System of Eigenvalue Equations of Operators	
9.3.4. Determination of System of Eigenfunctions and Eigenvalues and Complete Set of Quantum Numbers	
9.3.5. Determination of Shapes of "Probability Clouds"	
9.3.6. Interpretation of Results by Description of Stationary States with Help of Quantum Number Values	
9.4. Application of Main Method - Shell Model of Atomic Nucleus	168
9.5. Three-Dimensional Structure of Water Molecules	172

10. Relativistic Mechanics (Appendices B1,B6,B7,B8)

10.1. Description of Structure of Relativistic Mechanics	174
10.2. Relativistic Dynamics of Special Theory of Relativity	174
10.2.1. Motional Equation of Relativistic Mechanics	178
10.2.2. Einstein Relation for Energy	

11. Quantum and Relativistic Applications of Electromagnetic Field (Appendices B1,B4,B5,B6,B7,B8)

11.1. Quantum Theory of Free Monochromatic Electromagnetic Field	182
11.1.1. Application of Main Method of Quantum Mechanics of Stationary States to Linear Harmonic Oscillator	182
11.1.2. Conversion of Oscillator Set into Photon Set	
11.1.3. Comparison of Classical and Quantum Theories of Monochromatic Electromagnetic Field	
11.2. Quantum Theory of Free Polychromatic Electromagnetic Field	185
11.2.1. Semi-Classical Theory of Interaction with Electromagnetic Radiation	

11.2.2. Operators of Secondary Quantization	
11.2.3. Comparison of Quantum and Quasi-Classical Theories of Polychromatic Electromagnetic Field	
11.3. Wave-Particle Duality of Photons	190
11.3.1. Wave Packet as a Photon Model	
11.3.2. Wave Nature of the Photon	
11.3.3. Corpuscular Nature of the Photon	
11.4. Electromagnetic Radiation	194
11.4.1. Classical and Quantum Nature of Electromagnetic Radiation, and Structure of Optics	
11.4.2. Electromagnetic Spectrum	
11.4.3. Quantum Optics	
11.5. Relativistic Electron in Electrostatic Field	203
12. Classical, Quantum and Relativistic Applications of Nuclear Physics (Appendices B1 to B8)	206
12.1. Structure of Atomic Nucleus	206
12.2. Nuclear Radiation	210
12.2.1. Natural and Artificial Radioactivity	
12.2.2. Law of Radioactive Decay	
12.2.3. Law of Absorption	
12.3. Nuclear Radiation Quantities and Units	218
12.4. Nuclear Radiation Detection and Dosimetry	223
12.5. Observation and Acceleration of Nuclear Radiation Charged Particles	225
12.6. Nuclear Reactions (Induced Transmutations of Elements)	227

SET OF APPENDICES B

A Model of the Structure of Non-Statistical Physics	230
APPENDIX B1 Composition of the Model	230
APPENDIX B2 Representation of the Model of Classical Non-Statistical Physics	231
APPENDIX B3 Description of the Model of Classical Non-Statistical Physics	232
APPENDIX B4 Representation of the Model of Quantum Non-Statistical Physics	235
APPENDIX B5 Description of the Model of Quantum Non-Statistical Physics	237
APPENDIX B6 Representation of the Model of Relativistic Non-Statistical Physics	240
APPENDIX B7 Description of the Model of Relativistic Non-Statistical Physics	241
APPENDIX B8 Explanation of the Non-Statistical Physics Model in Chapters 7 to 12	243

C. IONIZING RADIATION AND ITS APPLICATIONS IN RADIOLOGY

13. Ionization of Medium, Ionization Tools and Methods, Ionizing Radiation	245
13.1. Process of Ionization of Medium	245
13.2. Outline of Ionizing and Non-Ionizing Types of Radiation and Wave Motion Employed in Radiology	247

14. Ionizing Radiation Sources and Interactions of Ionizing Radiation with Medium	249
14.1. Description of Sources	249
14.2. Description of Interactions	252
15. Measurement of Ionizing Radiation	258
15.1. Quantities and Units in Field of Ionizing Radiation	258
15.2. Ionizing Radiation Detection and Dosimetry	259
16. Physical Description of Radiodiagnostics and Radiotherapy	261
16.1. Description of Radiodiagnostics	261
16.2. Description of Radiotherapy	263
17. Physical Description of Imaging Techniques	265
17.1. Nuclear Medicine	265
17.2. Roentgenology	266
17.3. Thermography	267
17.4. Nuclear Magnetic Resonance	269
17.5. Sonography	271
18. Physical Principles of Magnetic Resonance	273
18.1. Physical Foundations	273
18.2. Physical Basis of Techniques Used	274
D. SUPPLEMENTS	276
Supplement 1 Knowledge of Mathematics Required for Application to Radiology	276
Supplement 2 Practising Statistical Physics	279
Supplement 3 Examples - Statistical Physics	282
Supplement 4 Practising Non-Statistical Physics	287
Supplement 5 Examples - Non-Statistical Physics	290
Supplement 6 Practising Ionizing Radiation and its Applications in Radiology	299
