

Preface

1.	Defining properties of Active Galactic Nuclei	4
1.1.	AGN across wavelengths	5
1.2.	AGN variability	13
1.3.	AGN structure and the unification scenarios	17
1.4.	AGN circumnuclear medium: the interplay of gas and stars	29
1.5.	AGN vs. inactive galaxies: the context of Milky Way's center	51
2.	Accretion onto supermassive black holes	77
2.1.	Strong gravity and accretion tori	77
2.2.	Main components of the radiation spectrum from black hole accretion . .	80
2.3.	X-ray reprocessing in accretion disk coronae	93
3.	Processes relevant for outflows and jets	99
3.1.	Strong-gravity and electromagnetic fields	99
3.2.	General Relativity framework	106
3.3.	Particle acceleration and jet launching near SMBH	117
4.	Unification of accreting black holes across the mass scale	121
4.1.	Fundamental plane of black hole activity	121
4.2.	Spectral states: AGN vs. microquasars?	122
4.3.	Very high energy particles and photons	126
5.	Appendix	131
5.1.	Mathematical formalism of spin coefficients	131
5.2.	The approach of Ernst potential	134
	Abbreviations and symbols	138
	Glossary and various symbols	138
	Acronyms	141
	References	143
	About authors	157
	Acknowledgments	158
	Postface	159
