Preface	ix
I Fundamentals of Universal Algebra	1
1 Algebras	3
1.1 Operations	3
1.2 Examples	4
1.3 More about subs, homs and prods	7
1.4 Generating subalgebras	10
1.5 Congruences and quotient algebras	13
2 Lattices	21
2.1 Ordered sets	21
2.2 Distributive and modular lattices	24
2.3 Complete lattices	30
2.4 Closure operators and algebraic lattices	34
2.5 Galois connections	38
2.6 Ideals in lattices	40
3 The Nuts and Bolts of Universal Algebra	47
3.1 The isomorphism theorems	47
3.2 Direct products	52
3.3 Subdirect products	55
3.4 Case studies	60
3.5 Varieties and other classes of algebras	71
4 Clones, Terms, and Equational Classes	79
4.1 Clones	79
4.2 Invariant relations	88
4.3 Terms and free algebras	94
4.4 Identities and Birkhoff's theorem	104
4.5 The lattice of subvarieties	111
4.6 Equational theories and fully invariant congruences	117
4.7 Maltsev conditions	121
4.8 Interpretations	130

II	Selected Topics	135
5	Congruence Distributive Varieties	139
5.1	Ultrafilters and ultraproducts	139
5.2	Jónsson's lemma	145
5.3	Model theory	149
5.4	Finitely based and nonfinitely based algebras	156
5.5	Definable principal (sub)congruences	160
6	Arithmetical Varieties	169
6.1	Large clones	169
6.2	How rare are primal algebras?	178
7	Maltsev Varieties	189
7.1	Directly representable varieties	189
7.2	The centralizer congruence	197
7.3	Abelian varieties	205
7.4	Commutators	216
7.5	Directly representable varieties revisited	224
7.6	Minimal varieties	233
7.7	Functionally complete algebras	239
8	Finite Algebras and Locally Finite Varieties	245
8.1	Minimal algebras	245
8.2	Localization and induced algebras	252
8.3	Centralizers again!	263
8.4	Applications	274
	Bibliography	291
	Index of Notation	299
	Index	303
