

Table of content

I. Introduction	1
II. Selected passages from biomechanics of motion	3
2.1 Inertial systems and study into kinematics and dynamics	3
2.2 Motion capture systems and study into kinematics and dynamics	8
2.3 Mechanics of throws and jumps	23
2.4 Kinematics and dynamics of rotational motion	26
2.5 EMG signal and muscular activity assessment	32
2.6 Myoelectric prostheses and their movement control	38
III. Selected applications of solving force and moment effects in biomechanics	47
3.1 Moments and forces in the wrist and fingers	47
3.2 Middle ear mechanism	51
3.3 Force relations in the upper limb forearm	56
3.4 Force relations in the shoulder	66
3.5 Loading of lower limb segments during walking	73
3.6 Force relations in the knee	78
3.7 Loading of the hip joint	86
3.8 Spinal loading and approximate calculation of stresses in vertebrae	91
3.9 Body stability and measurement of contact forces under lower limbs	97
3.10 Force relations in the prosthetic socket and its design	105
3.11 Forensic biomechanics and injury classification	109
3.12 Ergonomics and physical load assessment	114
3.13 Dynamics of high jump	118
3.14 Force effects in motion on skis	122
IV. Selected topics from biomechanics studying material properties	125
4.1 Models of biological structures in rheology	125
4.2 Strength design of medical devices	137
4.3 Tensometric systems and measurement of loading of prosthetic replacements	152
4.4 Basic mechanical properties of surfaces	163
V. References to used and recommended literature	166
