<b>Section I</b>	<b>1</b>
<b>Chapter 1 Introduction to Nitrogen Chemical Biology</b>	<b>3</b>
1.1 Nitrogen Chemical Biology	3
1.2 Properties of Atomic and Molecular Nitrogen Relevant to Biology	6
1.3 Accessible Nitrogen Oxidation States in Biology	8
1.4 Nitrogen Biogeochemical Cycling 1	10
1.5 Inorganic Nitrogen Metabolism uses the Eight-electron Nitrogen Redox Traverse in Either Direction	12
1.6 Nitrogen Biogeochemical Cycling 2	13
1.7 Crossover to Organic Nitrogen Chemical Biology by Enzymatic Capture of Ammonia	14
1.8 What Kinds of Nitrogen Molecules and Functional Groups Operate in Metabolism?	16
1.9 Nitrogen Heterocycles as Central Structural and Catalytic Groups	16
1.10 One-electron <i>vs.</i> Two-electron Nitrogen Redox Enzymology	19
1.11 Nitrogen Proteomics: Catalysis <i>vs.</i> Posttranslational Modifications	21
1.12 Overview	22
References	22

<b>Section II</b>	<b>24</b>
<b>Chapter 2 Inorganic Nitrogen Biochemistry and Dinitrogen Reduction to Ammonia by Nitrogenase</b>	<b>27</b>
2.1 Introduction to $N_2$ , $NH_3$ and $NO_3^-$	27
2.2 Nitrification, Denitrification and Reductive Assimilation	29
2.3 $N_2$ to $NH_3$ : Biological Fixation of Dinitrogen by Bacterial Nitrogenases	31
2.3.1 Alternative to Nitrogenase	32
2.3.2 The Haber-Bosch Industrial Process	32
2.4 Nitrogen-fixing Bacteria	33
2.4.1 Nitrogenase Structures and Reaction Stoichiometries	33
2.4.2 Nitrogenase Redox Cofactor Inventories	37
2.4.3 Thoughts on Nitrogenase Mechanisms	41
2.5 Nitrogen Hydride Biochemistry	45
References	45
<b>Chapter 3 Ammonia Oxidation: Nitrification vs. Anammox</b>	<b>48</b>
3.1 Nitrification: Ammonia Oxidation to Nitrate	48
3.1.1 Ammonia Oxidase	52
3.1.2 Hydroxylamine Oxidoreductase	55
3.1.3 Nitric Oxide Oxidase	58
3.1.4 Nitrite Oxidase (in Nitrite Oxidizing Bacteria)	58
3.1.5 Overview: Nitrification: Ammonia to Nitrate Oxidative Pathway	60
3.2 Anammox by the Anaerobic Bacterial Phylum Planctomycetes	60
3.2.1 Hydrazine Synthase	63
3.2.2 Hydrazine Dehydrogenase	66
3.3 Ammonification: Degradative Conversion of Organic Nitrogen Metabolites to $NH_3$	68
References	69
<b>Chapter 4 Nitrate Ion Reductive Metabolism: Bifurcation Between Five-electron or Eight-electron Reductions</b>	<b>72</b>
4.1 Two Modes of Biological Reduction of Nitrate Ions	72
4.2 Nitrate Reduction: $NO_3^-$ to $NH_3$ for Assimilation: Eight-electron Reduction	74
4.2.1 Nitrate Reductases	74
4.2.2 Nitrite Reductases	77

4.3 Denitrification: two $\text{NO}_3^-$ to $\text{N}_2$ , Net Ten-electron Reduction	81
4.3.1 Denitrifying Nitrate Reductase	81
4.3.2 Denitrifying Nitrite Reductases: One-electron Reductions	81
4.3.3 Nitric Oxide Reductase in Denitrifying Bacteria	83
4.3.4 Nitrous Oxide Reductase	86
4.4 Overview of the Metallocenter Inventory in the Denitrification Pathway	86
References	90
<b>Chapter 5 Chemical Strategies Underlying the Biological Flux of Inorganic Nitrogen Species</b>	<b>92</b>
5.1 Traversing the Full Range of Nitrogen Redox States	94
5.2 Three Reductive Metabolic Pathways, One Oxidative Pathway and One Mixed Pathway for Nitrogen Inorganics	94
5.3 Nitrogen Oxide vs. Nitrogen Hydride Chemical Biology	97
5.4 From One to Six Electrons Transferred in a Given Enzyme Site	99
5.5 Redox Cofactor Inventories	101
5.6 Turning to Organic Nitrogen Chemical Biology	102
References	103
<b>Section III</b>	<b>105</b>
<b>Chapter 6 Amination Reactions: Incorporation of Ammonia Into Amino Acid Frameworks</b>	<b>109</b>
6.1 Enzymatic Amination to Capture Ammonia: Imines and Amides	109
6.1.1 Glutamate Dehydrogenase: Reductive Amination of Substrate Carbonyl Groups	113
6.1.2 Glutamine Synthetase: $\text{NH}_3$ Organification via Amide Linkage	114
6.1.3 Glutamine Oxoglutarate Aminotransferase	116
6.2 Glutamine as Carrier of Latent Ammonia as a General Strategy in Enzymatic Aminations	116
6.2.1 Asparagine and Aspartate vs. Glutamate and Glutamine	119
6.3 Moving Amino Groups Around on Organic Scaffolds	121
6.3.1 Transaminase Logic	121

6.4	Reactions that Release Ammonia	126
6.4.1	Amino Acid Deaminases and Ammonia Lyases	126
6.4.2	Deamination by Amino Acid Dehydrogenases and Oxidases	129
6.4.3	Amidino Group Deaminases: Purines, Pyrimidines and Nucleic Acids	130
6.4.4	Release of $\text{NH}_3$ During Tetrapyrrole Macrocycle Biosynthesis	133
6.5	Overview	134
	References	134
<b>Chapter 7</b>	<b>When Ammonia Becomes Toxic: Ureido and Guanidinium Forms of Organic Nitrogen</b>	<b>137</b>
7.1	Maintaining a Steady State Nontoxic Level of Ammonia	137
7.2	Amidines, Guanidines and Ureas	139
7.3	Carbamate, Carbamyl Phosphate and Carbamyl Transfers	141
7.3.1	Carbamic Acid and Carbamyl Phosphate	142
7.3.2	Aspartate Transcarbamylase and Ornithine Transcarbamylase	144
7.3.3	Citrulline to Arginine: Ureido to Guanidinium Group <i>via</i> Addition-Elimination of Aspartate $\text{C}_2$ -Amino Group	146
7.3.4	Arginase Completes the Urea Cycle	148
7.3.5	Amidino Transfer from Arginine to Creatine	150
7.4	Overview	150
	References	152
<b>Chapter 8</b>	<b>Metabolic Capture of Amines, Imines and Enamines</b>	<b>153</b>
8.1	Amines, Imines and Enamines	153
8.1.1	Capture of Substrate Amino Groups in Electrophilic Group Transfer Reactions	155
8.1.2	Amine Acylations	156
8.1.3	Metabolic Amine Alkylations	158
8.1.4	Amine Glycosylations	162
8.1.5	<i>N</i> -Sulfurylations and <i>N</i> -Phosphorylations	163
8.1.6	<i>N</i> -Hydroxylations	165
8.2	Imine-Iminium Ion Reactions to Form or Cleave C-C Bonds	166
8.2.1	Ornithine to Cocaine: Four-iminium Intermediates	167
8.2.2	Tyrosine to Tetrahydroisoquinoline Alkaloid Framework	168
8.3	Enamine Intermediates as Carbanion Equivalents for C-C Bond Formation	170
	References	170

<b>Chapter 9</b>	<b>Nitrogen Heterocycles</b>	<b>172</b>
9.1	Introduction to Nitrogen Heterocycles	172
9.2	Amides, Amidines and Guanidines as H-bond Participants in DNA Base Pairs	174
9.3	Parsing the Origin of Nitrogens in Pyrimidines and Purines Reveals Simple Assembly Logic	176
9.3.1	Two Nitrogens in Uridine, Three in Cytidine	176
9.3.2	Five Nitrogens in AMP and GMP	179
9.4	Cyclic Amines, Amides and Other Nitrogen Heterocycles	182
9.5	Tryptophan and Tryptamine as Latent C <sub>3</sub> Carbanion–Enamine Equivalent	185
9.5.1	Tryptamine: Acylation, Alkylation and Iminium Formation	185
9.5.2	Physostigmine Biosynthetic Strategy	185
9.5.3	Imine to Beta Carboline Scaffold	186
9.5.4	Tryptophan: Diketopiperazine Formations and Internal Cyclizations	188
9.5.5	Alternate Regiochemistry of Indole Prenylations	191
9.6	Overview	192
	References	193
<b>Chapter 10</b>	<b>B Vitamin Nitrogen Heterocycles</b>	<b>195</b>
10.1	Seven Human B Vitamins Contain Functional Nitrogen Heterocycles	195
10.2	The Quaternized Thiazolium Ring in Thiamin-PP the Coenzyme Form of Vitamin B <sub>1</sub>	198
10.3	The Tricyclic Ring System of Flavin (B <sub>2</sub> ) Coenzymes: Nature's Step-down Redox Transformer	201
10.4	Dihydronicotinamides in Coenzyme Forms of Vitamin B <sub>3</sub> : Obligate Hydride Transfer Agents	202
10.5	Pyridoxal Phosphate (B <sub>6</sub> Coenzyme): a Pyridine for all Amino Acid Transformations	205
10.6	Biotin and Tetrahydrofolate: Carriers of One-carbon Units at all Four Oxidation States	207
10.6.1	Biotin	210
10.6.2	Folate	210
10.7	Vitamin B <sub>12</sub> : Two Organometallic Coenzyme Forms in a Modified Tetrapyrrole Macrocycle	212
10.8	Overview	215
	References	216

<b>Chapter 11</b>	<b>Tetrapyrrole Macrocycles: Aminopyrroles and the Pigments of Life</b>	<b>218</b>
11.1	Four Classes of Metallated Tetrapyrrole Macrocycles	218
11.2	Heme Biosynthesis	221
11.2.1	Two Routes to Aminolevulinate	221
11.2.2	Aminolevulinate to Porphobilinogen: Imine and Enamine Chemistry	223
11.2.3	Porphobilinogen	226
11.2.4	Porphobilinogen To Hydroxybilane	226
11.2.5	Uroporphyrinogen-III Synthase	230
11.2.6	Uroporphyrinogen-III to Protoporphyrin IX	231
11.3	Competing Chelataes: Insertion of $\text{Fe}^{2+}$ or $\text{Mg}^{2+}$	234
11.4	Two Biosynthetic Branchpoints Yield Tetrapyrrole Macrocycles with Equatorial Iron, Magnesium, Cobalt or Nickel	236
11.4.1	Branchpoint from Uroporphyrinogen-III to Siroheme, $\text{B}_{12}$ , and F430	236
11.4.2	Branchpoint at Protoporphyrin IX to Chlorophylls	239
11.5	Overview	241
	References	242
<b>Chapter 12</b>	<b>Organic Nitrogen Oxygenations</b>	<b>244</b>
12.1	Iron-based vs. Flavin-based <i>N</i> -Oxygenases	244
12.2	Two-electron Oxygenation of Amines to <i>N</i> -Hydroxylamines	246
12.2.1	An Unusual <i>N</i> -O-Sugar Linkage in the Eneidyne Antitumor Antibiotic Calicheamicin	249
12.2.2	Lysine to <i>N</i> -Hydroxy-pipecolate in Plant Defense	249
12.3	Six-electron Oxidations of Amines to Nitroso and Nitro Groups	252
12.4	Nitrones and Oximes	256
12.5	Glucosinolates	258
12.6	Ornithine and Lysine to Hydrazine Derivatives via <i>N</i> -O Linkages	260
12.7	Arginine <i>N</i> -Hydroxylation: to D-Cycloserine	260
12.8	Nitric Oxide Synthase. Three-electron <i>N</i> -Oxidation of Arginine Guanidium Group	263
12.8.1	Four Coenzymes Act <i>Ad Seriatim</i> to Funnel Electrons to a P450 Type Heme	265
12.9	Human Flavin Monooxygenase (FMO) Isozymes	267
	References	267

<b>Chapter 13</b>	<b>Nitriles, Cyanohydrins and Cyanogenesis</b>	<b>271</b>
13.1	Hydrogen Cyanide and Cyanide Anion	271
13.2	Plant Cytochrome P450s Convert Amino Acids to Cyanohydrin Glycosides	274
13.2.1	The Subclass of Cyp79 Heme <i>N</i> -Oxygenases Convert Amino Acids to Aldoximes	274
13.2.2	From Aldoxime to Trapped Cyanohydrin Acetals	275
13.3	Two-step Cyanogenesis from the Cyanogenic Glycosides	276
13.4	Recapture of Cyanide by Cyanoalanine Synthase and Conversion to Asparagine or Aspartate	277
13.5	Toyocamycin: Nitrile Formation and Reduction	280
13.6	Additional Cyanogenesis Strategies	283
13.6.1	Enzymatic Oxidative Fragmentation of 1-Amino-1-carboxy-cyclopropane to Ethylene, Cyanide Ion and Carbon Dioxide	283
13.6.2	Two Bacterial Amino Acid Fragmentations to Cyanide	284
13.7	Biological Formation of Isonitriles	288
13.8	Overview	289
	References	290
<b>Chapter 14</b>	<b>One-electron Nitrogen Chemical Biology</b>	<b>292</b>
14.1	One-electron Transfers To and From Inorganic Nitrogen Atoms	292
14.2	Two-electron vs. One-electron Redox Manifolds on Organic Nitrogen Scaffolds	293
14.2.1	PLP-dependent Transaminases are Redox Catalysts but Leave the Nitrogen Oxidation State Unchanged	295
14.3	Organic Nitrogen Radical Metabolites	296
14.3.1	Parallel One- and Two-electron Strategies in Substrate Amine <i>N</i> -Oxygenations	297
14.3.2	One-electron Transfer in All Phases of Cytochrome P450 <i>N</i> -oxygenations	299
14.3.3	Nitrogen Radical Coupling to Carbon and Nitrene Transfer by Cytochrome P450s	301
14.3.4	Cyanogenesis Involves Nitrogen Radicals in Cyanide Ion Formation	303
14.3.5	Nitric Oxide Synthase Revisited for One-electron Transfer Mechanisms	304
14.4	Nitric Oxide Biology	306
14.4.1	Direct and Indirect Effects of Nitric Oxide in Higher Eukaryotes	307
14.4.2	Interaction with Guanylate Cyclase	311
14.5	Overview	311
	References	312

<b>Section IV</b>	<b>314</b>
<b>Chapter 15 Peptide Bond Formation Strategies in Nonribosomal and Ribosomal Assembly Lines</b>	<b>319</b>
15.1 Peptide Bonds	319
15.2 Strategies for Amino Acid Monomer Activation for Peptide Bond Formation	320
15.2.1 Conversion of Ammonium Cations to Amine Nucleophiles by Deprotonation	321
15.2.2 Carboxylate Activation <i>via</i> Mixed Acyl-Phosphoric Anhydrides at the Expense of ATP Side Chain Cleavage	322
15.2.3 Harvesting the Thermodynamic Activation of Mixed Acyl-Phosphoric Anhydrides in Kinetically Stable Acyl Derivatives	322
15.3 ATP Grasp Family of ADP-forming Amide Bond Synthetases	325
15.4 Peptide Bond Initiation, Elongation and Termination at the Ribosomal RNA Machine	327
15.4.1 Ribosomal Initiation of Peptide Chain Formation	327
15.4.2 Peptidyl Chain Elongation at the Ribosome	328
15.4.3 Peptidyl Chain Termination at the Ribosome	330
15.5 Chemical Logic for Nonribosomal Peptide Synthetase Assembly Lines	330
15.5.1 NRPS Assembly Line Architecture	337
15.6 ACV Synthetase: A Three Module NRPS Assembly Line	340
15.6.1 ACV Synthetase Initiation Module	340
15.6.2 ACV Synthetase Elongation Module	340
15.6.3 ACV Synthetase Termination Module	341
15.7 Nonribosomal Peptide Variants	341
15.8 Overview	343
References	344
<b>Chapter 16 Nitrogen Side Chains in Enzyme Catalysis and Posttranslational Modifications</b>	<b>347</b>
16.1 Six Proteinogenic Amino Acid Building Blocks with Side Chain Nitrogen Atoms	347
16.2 Transient <i>vs.</i> Stable Covalent Adducts on Protein Residue Nitrogen Side Chains	350
16.3 Histidine as Acid-Base and Nucleophilic Catalyst	351
16.3.1 Base-Acid Catalysis in Serine and Cysteine Proteases	351

16.3.2 Histidine as a Nucleophile: Histidine Autokinases	353
16.3.3 Posttranslational Methylation at N <sub>1</sub> or N <sub>3</sub> of the Imidazole Ring	355
16.4 Protein Lysine N <sub>6</sub> as a Nucleophile for Alkylations, Acylations, AMPylations and Imine–Enamine Tautomerizations	356
16.4.1 Iminium Ion Formations	356
16.4.2 AMPylations in DNA Ligase Catalytic Repair of DNA Strand Breaks	358
16.4.3 Iterative Methylations	361
16.4.4 (Reversible) Posttranslational Acylations by Acyl CoA Metabolites	365
16.4.5 Acylations by Information-rich Ubiquitin and SUMO Isoforms	367
16.5 Arginine, an Unlikely Protein Side Chain Nucleophile	373
16.5.1 Bacterial Arginine Kinases	375
16.5.2 Arginine Guanidinium Methylations	375
16.5.3 Protein Arginine Deiminases	377
16.5.4 Arginine ADP-ribosylations	377
16.5.5 Nitroarginine Formation	379
16.6 Asparagine, an Even More Unlikely Protein Side Chain Nucleophile	379
16.7 Posttranslational Glutamine Deamidations	382
16.8 Tryptophan C <sub>2</sub> -Mannosylation as an Expression of Indole Ring Reactivity	384
16.9 Overview	386
References	386
