List of contributors	xv
Abbreviations	xvii
1. What is cancer? L. M. FRANKS	1
1.1 Introduction	1
1.2 Normal cells and tissues	2
1.3 Control of growth in normal cells	3
1.4 The cell cycle	3
1.5 Tumour growth or neoplasia	4
1.6 The process of carcinogenesis	4
1.7 Factors influencing the development of cancers	6
1.8 The natural history of cancer or tumour progression	7
1.9 The diagnosis of tumours	9
1.10 The names of tumours (nomenclature) and the need for tissue diagnosis	11
1.11 Tumour staging and the spread of tumours—metastasis	14
1.12 How tumours present—some effects of tumours on the body	15
1.13 How does cancer kill?	16
1.14 Treatment of cancer	16
1.15 Cancer prevention and screening	16
1.16 Experimental methods in cancer research	17
1.17 Experimental methods for tumour identification	18
1.18 Conclusions	19
References and further reading	19
2. The spread of tumours I. R. HART	21
2.1 Introduction	21
2.2 Tumour angiogenesis	22
2.3 Mechanisms of tumour invasion	23
2.4 Dissemination of tumour cells via lymphatics and/or blood vessels	25
2.5 Patterns of metastatic spread	27
2.6 The role of the immune system in modulating metastasis	28
2.7 Tumour cell heterogeneity	29
2.8 Experimental models/approaches to metastasis	31
2.9 Summary	32
References and further reading	32

3. Epidemiology of cancer	T. KEY, D. FORMAN, AND M. C. PIKE	34
3.1	Introduction	34
3.2	Descriptive epidemiology	34
3.3	Analytical epidemiology	38
3.4	Identifying the causes	39
3.5	Risk factors	50
	References and further reading	59
4. Inherited susceptibility to cancer		
H. S. WASAN AND W. F. BODMER		60
4.1	Introduction: the cellular genetic basis for cancer	60
4.2	Evidence for a genetic basis	61
4.3	Genetic markers, DNA polymorphisms, and genetic linkage	64
4.4	Dominant inherited susceptibility and recessive genetic changes in tumours	69
4.5	Systemic inherited susceptibilities	83
4.6	Types of family data and their interpretation	86
4.7	Conclusions and future prospects	88
	References and further reading	90
5. Structure of DNA and its relationship to carcinogenesis		
BEVERLY E. GRIFFIN		92
5.1	Introduction	92
5.2	Components of DNA	93
5.3	The genetic material	97
5.4	'Informational' DNA	100
5.5	DNA damage	101
5.6	DNA manipulation	103
5.7	Conclusion	104
	References and further reading	105
6. Chemical carcinogenesis		
RAYMOND TENNANT, CAROLINE WIGLEY, AND ALAN BALMAIN		106
6.1	The role of chemical carcinogens and mutation in human cancer	106
6.2	Epidemiological evidence	107
6.3	Evidence from animal studies	111
6.4	Molecular evidence	111
6.5	Experimental approaches to the study of carcinogenesis by chemicals	113
6.6	The role of tumour promotion in human cancer	119
6.7	Screening for carcinogens	120

6.8	Prospects	126
6.9	Summary	127
	References and further reading	128
7.	Radiation carcinogenesis G. E. ADAMS AND R. COX	130
7.1	Introduction	130
7.2	Radiation and human cancer	133
7.3	Cellular and molecular processes	139
	References and further reading	148
8.	Viruses and cancer JOHN WYKE	151
8.1	Introduction	151
8.2	The history of tumour virology	151
8.3	Implicating viruses in experimental and natural cancers	154
8.4	Risk factors predisposing to virus-associated neoplasia	154
8.5	Important tumour viruses of animals and humans	157
8.6	Prophylaxis and therapy of virus-associated neoplasia	161
8.7	The mechanisms of virus-induced neoplasia	162
8.8	Conclusions	167
	References and further reading	167
9.	Oncogenes and cancer NATALIE M. TEICH	169
9.1	What is an oncogene?	169
9.2	Identification of viral and cellular oncogene products	178
9.3	Tumour suppressor genes	185
9.4	Interactions between oncogenes	194
9.5	Protooncogene expression in normal development and differentiation	197
9.6	Lessons learned from oncogenes	198
	References and further reading	201
10.	Chromosomes and cancer DENISE SHEER	202
10.1	Introduction	202
10.2	Methodology	203
10.3	Terminology and types of chromosome aberrations in tumours	204
10.4	Molecular consequences of chromosome aberrations in tumours	205
10.5	Chromosomes in leukaemias and lymphomas	207
10.6	Chromosomes in solid tumours	215

10.7	Conclusions and future prospects	224
	References and further reading	225
11.	Growth factor signalling pathways in cancer	
	ALASTAIR D. REITH AND GEORGE PANAYOTOU	230
11.1	Structural and functional diversity of growth factors	230
11.2	Structure and diversity of growth factor receptors	232
11.3	Intracellular signalling by activated growth factor receptors	238
11.4	Oncogenic activation of signalling molecules	242
11.5	Signal transduction pathways and cancer	245
11.6	Abnormal growth control in cancer—a summary	248
	References and further reading	249
12.	Stem cells, haemopoiesis, and leukaemia MEL GREAVES	251
12.1	Introduction	251
12.2	Haemopoietic regulation	251
12.3	Leukaemia as a clonal disorder of haemopoiesis	254
12.4	Gene culprits	256
12.5	Origin of mutations and the natural history of leukaemia	257
12.6	Target cells in leukaemia	257
12.7	Clinical and epidemiological implications of leukaemic cell and molecular biology	259
	References and further reading	263
13.	The molecular pathology of cancer	
	NICHOLAS R. LEMOINE AND GORDON STAMP	264
13.1	Introduction	264
13.2	Morphological analysis of tumour tissue	264
13.3	Immunohistochemistry and immunocytochemistry	266
13.4	Nucleic acid changes using in situ hybridization	268
13.5	Genetic abnormalities in neoplasia	270
13.6	Tumour markers	272
	References and further reading	272
14.	Hormones and cancer M. G. PARKER AND L. M. FRANKS	274
14.1	Introduction	274
14.2	Basic endocrinology	275
14.3	Molecular mechanisms of hormone action; nuclear receptors	277
14.4	Hormones and carcinogenesis	282
14.5	The mode of action of hormones in carcinogenesis	285

14.6	Types and nature of hormone-sensitive and hormone-producing tumours	293
14.7	Treatment of hormone-sensitive human cancers	295
14.8	Conclusions and future prospects	296
	References and further reading	297
15.	The neuroendocrine system and its tumours	
	J. M. POLAK AND S. R. BLOOM	299
15.1	Morphological features of peptide-containing endocrine cells and nerves	299
15.2	Techniques for the visualization of the 'diffuse neuroendocrine system'	300
15.3	Neuroendocrine tumours	304
15.4	Individual tumours	305
15.5	Conclusions	309
	References and further reading	310
16.	Immunology of cancer PETER BEVERLEY	311
16.1	Introduction to the immune system	311
16.2	Organization of the immune system	311
16.3	The immune system and cancer	317
16.4	Cell-mediated immune responses to cancer	319
16.5	Human tumour antigens detected by antibodies	322
16.6	Immunodiagnosis	325
16.7	Immunotherapy and immune escape mechanisms	325
16.8	Conclusions	328
	References and further reading	329
17.	The local treatment of cancer IAN FENTIMAN	330
17.1	How tumours present	330
17.2	Screening	330
17.3	Diagnosis	332
17.4	Staging	336
17.5	Treatment	338
17.6	Problem areas	341
	References and further reading	342
18.	Chemotherapy J. S. MALPAS	343
18.1	Introduction	343
18.2	Classification of chemotherapeutic drugs	344
18.3	Pharmacokinetic principles	345
18.4	Pharmacology of the main classes of agents	346
18.5	Drug toxicity	347

18.6	Principles of chemotherapy	347
18.7	Administration of anticancer drugs	348
18.8	Drug resistance	349
18.9	Clinical trials	351
18.10	Supportive care	351
18.11	Conclusion	351
	References and further reading	352
19.	Monoclonal antibodies and therapy PHILIP E. THORPE, EDWARD J. WAWRZYNCZAK AND FRANCIS J. BURROWS	353
19.1	Introduction	353
19.2	Tumour-associated antigens	358
19.3	Tumour imaging	362
19.4	Immunotherapy	365
19.5	Targeting of cytotoxic agents	370
19.6	Bone marrow transplantation	376
19.7	Conclusion	377
	References and further reading	378
20.	Cytokines and cancer FRANCES R. BALKWILL	380
20.1	Cytokines and the cytokine network	380
20.2	Cytokine networks in cancer	383
20.3	Cytokine treatment of cancer	386
	References and further reading	390
21.	Screening and chemoprevention JACK CUZICK	392
21.1	Types of screening tests	393
21.2	Safety and acceptability	393
21.3	Who should be screened?	394
21.4	Evaluation of screening	394
21.5	Screening for specific cancers	396
21.6	The need for DNA sequencing in epidemiology	409
21.7	Conclusion	409
	References and further reading	410
22.	Some conclusions and prospects ROBIN A. WEISS	415
22.1	Understanding carcinogenesis	415
22.2	Prospects for prevention and screening	417
22.3	Prospects for new treatment	419
22.4	Prospects for gene therapy	420
22.5	Conclusion	425
	References and further reading	425

Glossary	427
