Table of Contents

Preface 1

Chapter 1: PostgreSQL 13 Overview 7
What's new in PostgreSQL 13? 7
Digging into SQL and developer-related topics 8
Improving psql command-line handling 8
Improving pgbench 8
Generating random UUIDs more easily 9
Dropping databases faster 9
Adding ALTER TABLE ... DROP EXPRESSION ... 10
Making use of performance improvements 11
Deduplication of B-tree indexes 11
Adding incremental sorting 12
Adding -j 8 to reindexdb 14
Allowing hash aggregates to spill to disk 15
Speeding up PL/pgSQL 17
Parallelizing VACUUM operations 17
Allowing skipping of WAL for full table writes 18
Additional performance improvements 18
Making monitoring more powerful 19
Additional system views 19
Summary 21

Chapter 2: Understanding Transactions and Locking 23
Working with PostgreSQL transactions 24
Handling errors inside a transaction 27
Making use of SAVEPOINT 28
Transactional DDLs 29
Understanding basic locking 30
Avoiding typical mistakes and explicit locking 32
Considering alternative solutions 34
Making use of FOR SHARE and FOR UPDATE 35
Understanding transaction isolation levels 39
Considering Serializable Snapshot Isolation transactions 40
Observing deadlocks and similar issues 41
Utilizing advisory locks 43
Optimizing storage and managing cleanup 44
Configuring VACUUM and autovacuum 45
Digging into transaction wraparound-related issues 46
A word on VACUUM FULL 48
Watching VACUUM at work 48
Limiting transactions by making use of snapshot too old 51

Making use of more VACUUM features 52
Summary 53
Questions 53

Chapter 3: Making Use of Indexes 55
Understanding simple queries and the cost model 56
Making use of EXPLAIN 57
Digging into the PostgreSQL cost model 59
Deploying simple indexes 61
Making use of sorted output 62
Using more than one index at a time 63
Using bitmap scans effectively 64
Using indexes in an intelligent way 65
Understanding index de-duplication 67
Improving speed using clustered tables 68
Clustering tables 71
Making use of index-only scans 72
Understanding additional B-tree features 73
Combined indexes 74
Adding functional indexes 75
Reducing space consumption 76
Adding data while indexing 77
Introducing operator classes 78
Creating an operator class for a B-tree 80
Creating new operators 80
Creating operator classes 84
Testing custom operator classes 84
Understanding PostgreSQL index types 85
Hash indexes 86
GiST indexes 86
Understanding how GiST works 87
Extending GiST 88
GIN indexes 89
Extending GIN 90
SP-GiST indexes 91
BRIN indexes 92
Extending BRIN indexes 93
Adding additional indexes 93
Achieving better answers with fuzzy searching 95
Taking advantage of pg_trgm 95
Speeding up LIKE queries 97
Handling regular expressions 98
Understanding full-text search 99
Comparing strings 100
Defining GIN indexes 101
Debugging your search 102

Gathering word statistics 103
Taking advantage of exclusion operators 103
Summary 104
Questions 105

Chapter 4: Handling Advanced SQL 107
Introducing grouping sets 108
Loading some sample data 108
Applying grouping sets 109
Investigating performance 111
Combining grouping sets with the FILTER clause 113
Making use of ordered sets 113
Understanding hypothetical aggregates 116
Utilizing windowing functions and analytics 117
Partitioning data 118
Ordering data inside a window 119
Using sliding windows 120
Understanding the subtle difference between ROWS and RANGE 123
Removing duplicates using EXCLUDE TIES and EXCLUDE GROUP 125
Abstracting window clauses 127
Using on-board windowing functions 127
The rank and dense_rank functions 128
The ntile() function 129
The lead() and lag() functions 130
The first_value(), nth_value(), and last_value() functions 133
The row_number() function 135
Writing your own aggregates 135
Creating simple aggregates 136
Adding support for parallel queries 139
Improving efficiency 140
Writing hypothetical aggregates 142
Summary 144

Chapter 5: Log Files and System Statistics 145
Gathering runtime statistics 145
Working with PostgreSQL system views 146
Checking live traffic 146
Inspecting databases 149
Inspecting tables 152
Making sense of pg_stat_user_tables 153
Digging into indexes 155
Tracking the background worker 156
Tracking, archiving, and streaming 157
Checking SSL connections 160
Inspecting transactions in real time 161
Tracking VACUUM and CREATE INDEX progress 162
Using pg_stat_statements 164

Creating log files 169
Configuring the postgresql.conf file 169
Defining log destination and rotation 170
Configuring syslog 171
Logging slow queries 172
Defining what and how to log 172
Summary 175
Questions 176
Chapter 6: Optimizing Queries for Good Performance 177
Learning what the optimizer does 177
A practical example – How the query optimizer handles a sample query 178
Evaluating join options 178
Nested loops 179
Hash joins 179
Merge joins 179
Applying transformations 180
Applying equality constraints 181
Exhaustive searching 182
Checking out execution plans 182
Making the process fail 184
Constant folding 185
Understanding function inlining 186
Introducing join pruning 188
Speedup set operations 189
Understanding execution plans 191
Approaching plans systematically 191
Making EXPLAIN more verbose 193
Spotting problems 194
Spotting changes in runtime 194
Inspecting estimates 195
Inspecting buffer usage 197
Fixing high buffer usage 198
Understanding and fixing joins 199
Getting joins right 199
Processing outer joins 201
Understanding the join_collapse_limit variable 202
Enabling and disabling optimizer settings 203
Understanding genetic query optimization 206
Partitioning data 208
Creating inherited tables 208
Applying table constraints 210
Modifying inherited structures 212
Moving tables in and out of partitioned structures 213
Cleaning up data 214
Understanding PostgreSQL 13.x partitioning 215
Adjusting parameters for good query performance 217

Speeding up sorting 220
Speeding up administrative tasks 223
Making use of parallel queries 224
What is PostgreSQL able to do in parallel? 228
Parallelism in practice 229
Introducing JIT compilation 230
Configuring JIT 231
Running queries 231
Summary 234
Chapter 7: Writing Stored Procedures 235
Understanding stored procedure languages 235
Understanding the fundamentals of stored procedures versus functions 237
The anatomy of a function 238
Introducing dollar quoting 239
Making use of anonymous code blocks 240
Using functions and transactions 240
Exploring various stored procedure languages 242
Introducing PL/pgSQL 243
Handling quoting and the string format 243
Managing scopes 247
Understanding advanced error handling 248
Making use of GET DIAGNOSTICS 250
Using cursors to fetch data in chunks 251
Utilizing composite types 255
Writing triggers in PL/pgSQL 256
Writing stored procedures in PL/pgSQL 261
Introducing PL/Perl 263
Using PL/Perl for data type abstraction 264
Deciding between PL/Perl and PL/PerlU 265
Making use of the SPI interface 266
Using the SPI for set returning functions 267
Escaping in PL/Perl and support functions 269
Sharing data across function calls 269
Writing triggers in Perl 270
Introducing PL/Python 270
Writing simple PL/Python code 271
Using the SPI interface 271
Handling errors 273
Improving functions 274
Reducing the number of function calls 275
Using cached plans 276
Assigning costs to functions 276
Using functions for various purposes 277
Summary 279
Questions 279
Chapter 8: Managing PostgreSQL Security 281

Managing network security 281
Understanding bind addresses and connections 282
Inspecting connections and performance 284
Living in a world without TCP 284
Managing pg_hba.conf 286
Handling SSL 289
Handling instance-level security 291
Creating and modifying users 294
Defining database-level security 297
Adjusting schema-level permissions 299
Working with tables 302
Handling column-level security 303
Configuring default privileges 304
Digging into RLS 305
Inspecting permissions 310
Reassigning objects and dropping users 313
Summary 314
Questions 315

Chapter 9: Handling Backup and Recovery 317
Performing simple dumps 317
Running pg_dump 318
Passing passwords and connection information 319
Using environment variables 320
Making use of .pgpass 321
Using service files 321
Extracting subsets of data 322
Handling various formats 323
Replaying backups 325
Handling global data 326
Summary 327
Questions 327

Chapter 10: Making Sense of Backups and Replication 329
Understanding the transaction log 330
Looking at the transaction log 331
Understanding checkpoints 332
Optimizing the transaction log 332
Transaction log archiving and recovery 334
Configuring for archiving 334
Configuring the pg_hba.conf file 335
Creating base backups 336
Reducing the bandwidth of backups 337
Mapping tablespaces 338
Using different formats 338
Testing transaction log archiving 339

Replaying the transaction log 340
Finding the right timestamp 342
Cleaning up the transaction log archive 344
Setting up asynchronous replication 346
Performing a basic setup 346
Improving security 348
Halting and resuming replication 349
Checking replication to ensure availability 350
Performing failovers and understanding timelines 353
Managing conflicts 354
Making replication more reliable 356
Upgrading to synchronous replication 357
Adjusting durability 359
Making use of replication slots 361
Handling physical replication slots 362
Handling logical replication slots 364
Use cases for logical replication slots 366
Making use of the CREATE PUBLICATION and CREATE SUBSCRIPTION commands 367
Summary 369
Questions 369

Chapter 11: Deciding on Useful Extensions 371
Understanding how extensions work 372
Checking for available extensions 373
Making use of contrib modules 376
Using the adminpack module 376
Applying bloom filters 378
Deploying btree_gist and btree_gin 380
dblink – considering phasing out 382
Fetching files with file_fdw 382
Inspecting storage using pageinspect 384
Investigating caching with pg_buffercache 386
Encrypting data with pgcrypto 388
Prewarming caches with pg_prewarm 388
Inspecting performance with pg_stat_statements 390
Inspecting storage with pgstattuple 390
Fuzzy searching with pg_trgm 392
Connecting to remote servers using postgres_fdw 392
Handling mistakes and typos 396
Other useful extensions 397
Summary 398

Chapter 12: Troubleshooting PostgreSQL 399
Approaching an unknown database 400
Inspecting pg_stat_activity 400

Querying pg_stat_activity 401
Treating Hibernate statements 402
Figuring out where queries come from 403
Checking for slow queries 403
Inspecting individual queries 405
Digging deeper with perf 405
Inspecting the log 407
Checking for missing indexes 407
Checking for memory and I/O 408
Understanding noteworthy error scenarios 410
Facing clog corruption 411
Understanding checkpoint messages 412
Managing corrupted data pages 413
Careless connection management 414
Fighting table bloat 414
Summary 415
Questions 415
Chapter 13: Migrating to PostgreSQL 417
Migrating SQL statements to PostgreSQL 417
Using lateral joins 418
Supporting lateral joins 418
Using grouping sets 418
Supporting grouping sets 419
Using the WITH clause – common table expressions 419
Supporting the WITH clause 420
Using the WITH RECURSIVE clause 421
Supporting the WITH RECURSIVE clause 421
Using the FILTER clause 421
Supporting the FILTER clause 422
Using windowing functions 422
Supporting windowing and analytics 422
Using ordered sets – the WITHIN GROUP clause 423
Supporting the WITHIN GROUP clause 423
Using the TABLESAMPLE clause 424
Supporting the TABLESAMPLE clause 424
Using limit/offset 425
Supporting the FETCH FIRST clause 425
Using the OFFSET clause 425
Supporting the OFFSET clause 426
Using temporal tables 426
Supporting temporal tables 426
Matching patterns in time series 427
Moving from Oracle to PostgreSQL 427
Using the oracle_fdw extension to move data 427
Using ora_migrator for fast migration 429

CYBERTEC Migrator – migration for the "big boys" 431
Using Ora2Pg to migrate from Oracle 431
Common pitfalls 434
Handling data in MySQL and MariaDB 436
Changing column definitions 437
Handling null values 439
Expecting problems 440
Migrating data and schemas 440
Using pg_chameleon 441
Using FDWs 442
Summary 444
