<b>Foreword</b>	
<b>1 Heat development in fire compartment</b> .....	7
1.1 Boundary of enclosure and heat development in fire compartment .....	10
1.2 Steel temperature during local fire .....	12
1.3 Temperature of external steelwork .....	14
1.4 Column temperature in a localized fire .....	16
1.5 Parametric temperature curve of heating of external components .....	18
1.6 Prediction of column temperature exposed to localized fire .....	20
1.7 Uniformal heating of external elements during fire .....	22
1.8 Accuracy of the gas temperature prediction in the compartment fire .....	24
1.9 Temperature of column located outside the fire compartment .....	26
1.10 Travelling fire in multi-storey buildings .....	28
<b>2 Structural elements</b> .....	31
2.1 Behaviour of steel beam under fire .....	34
2.2 Temperature distribution in I cross section under fire .....	36
2.3 Temperature of timber – concrete section exposed to natural fire .....	38
2.4 Lightweight timber wall panel under fire .....	40
2.5 Prediction of fire resistance of prestressed panel .....	42
2.6 Local buckling of steel beam under fire of a multi storey building .....	44
2.7 Fire behaviour of timber – concrete composite floor .....	46
2.8 Mechanical properties of steel at elevated temperatures .....	48
2.9 Trapezoidal sheet under ambient temperatures .....	50
2.10 Buckling resistance of columns exposed to local fire .....	52
2.11 Column web at elevated temperature in fire .....	54
2.12 Slender stainless steel members at elevated temperatures .....	56
2.13 Simplified model for temperature of columns exposed to localized fire .....	58
2.14 Temperature of fire protected steel column in unprotected structure .....	60
2.15 Temperature of galvanised elements .....	62
2.16 Beams with corrugated web at elevated temperatures in fire .....	64
2.17 Mechanical response of steel and composite structures exposed to fire .....	66

<b>3</b>	<b>Integrated thermal and mechanical analysis</b> .....	69
3.1	Structural integrity under fire .....	72
3.2	Fire experiment on the small compartment.....	74
3.3	Tie forces during compartment fire .....	76
3.4	Interaction of compression and bending with lateral torsional instability .....	78
3.5	Cassette wall exposed to fire .....	80
3.6	Major data from fire experiment in Mokrsko .....	82
3.7	Steel and concrete slab in fire .....	84
3.8	Timber – concrete composite structures in fire.....	86
3.9	Fire resistance of multi-storey timber based buildings .....	88
<b>4</b>	<b>Structural connections</b> .....	91
4.1	Component-based method for connection fire design .....	94
4.2	Temperature development in fin plate connection under fire .....	96
4.3	Temperature of header plate connection during fire .....	98
4.4	Temperature of sandwich panel connection .....	100
4.5	Mechanical model for simplified design of connection in fire .....	102
4.6	Connections with improved fire resistance .....	104
4.7	Self – drilling screws at elevated temperatures .....	106
4.8	Column web in shear at elevated temperatures .....	108
4.9	Temperature of connections with improved fire resistance .....	110
<b>5</b>	<b>Worked examples</b> .....	113
5.1	Concrete beam by 500°C isotherm method .....	117
5.2	Concrete wall by zone method .....	119
5.3	Fire unprotected steel beam by critical temperature method .....	120
5.4	Fire protected steel column by step by step procedure .....	125
5.5	Encased composite beam by tables and simple method .....	128
5.6	Composite beam.....	131
5.7	Partially encased composite column by tables and simple method .....	132
5.8	Solid timber beam by reduced properties method .....	136
5.9	Fire protected timber column by reduced cross-section method .....	138
<b>6</b>	<b>List of symbols</b> .....	141
<b>7</b>	<b>References</b> .....	147
