

TABLE OF CONTENTS

	Page
ABBREVIATIONS	10
INTRODUCTION - THEORETICAL FUNDAMENTALS	11
1 THE INDUSTRIAL REVOLUTION AND ITS CONSEQUENCES	16
1.1 History and Motives of Environmental Compatible Structures	16
1.2 References	19
2 DEVELOPMENT MOTIVES OF THE THEORY OF ENVIRONMENTALLY COMPATIBLE STRUCTURES (ECS)	20
2.1 Environmental Impact of the Industrial Growth in the 20 th and 21 st Centuries	20
2.2 Environmental Impacts of Buildings and Civil Engineering Structures	21
2.3 Focus of the Textbook	22
2.4 (E-C) Factor Reflecting the Extra Cost of EC Buildings	24
2.5 References	26
3 THEORY OF ECS	27
3.1 Concept of the Theory of ECS - Four Basic Components of the Theory of ECS	27
3.2 A. Three Principles of the Theory of ECS - General Comments	29
3.3 Comments to the Three Principles of the Theory of ECS	35
3.4 B. Design Characteristics (DCH) as Practical Design Tools of the Theory of ECS	36
3.4.1 Concept of the Design Characteristics (DCH)	36
3.4.2 Design Characteristics of Common and Special Buildings - DCH of Indoor Facilities and Reconstructions	40
3.4.3 Comments to the DCH's	45
3.4.4 Research, Experimental Studies and Development in the Field of ECS	46
3.5 C. Analytical and Non-analytical Optimization of the DCH's	46
3.5.1 Commentary on Engineering and Environmental Optimization	48
3.5.2 Comments on the Environmental Effect of Greenhouse Gas Emissions	49
3.6 D. Environmental Impact of Structural Forms and Systems	50
3.6.1 Introduction	50
3.6.2 Definitions	53
3.6.3 Impact of the Structural Form on the Environmental Compatibility of Structures	54
3.6.4 Physical Geometry (PhG) - a New Concept of Form-finding Process	59
3.6.5 Examples of Physically Defined Forms (PhDF) in Structural Engineering, Architecture and in Nature	62

3.6.6	Examples of Physically Defined Structural Forms (PhDF) Generated by Nature or Applied in Structural Design	78
3.6.7	Physically Defined Forms in Hydrotechnics and Futurology of Structural Forms	85
3.7	Energy Production and CO ₂ Emission Interrelationship	86
3.7.1	Introduction	86
3.7.2	Carbon Containing Fuels	86
3.7.3	Production of Carbon Dioxide	87
3.7.4	Production of Energy	87
3.7.5	Energetic Efficiency	88
3.7.6	Relation between Carbon Dioxide Emission and Energy Production	88
3.8	Sustainable Electricity Generation with Solar Updraft Towers	90
3.8.1	Motivation and Concept	90
3.8.2	The Solar updraft Tower – a Solution for Sunny Countries	95
3.8.3	Investment Cost and Levelised Electricity Cost	100
3.8.4	Environmental Analysis	101
3.8.5	Conclusion	102
3.9	Principles and Strategies for Achieving Environmental Compatibility in Rehabilitation of Structures	103
3.9.1	Principles and Strategies for Environmentally Compatible Renovations	104
3.9.2	Ratio of Primary to Secondary Structure	105
3.9.3	Comments	106
3.10	Comments on Methods Measuring the Levels of Environmental Performance of Buildings	107
3.10.1	Introduction	107
3.10.2	Methods Using LCA	107
3.10.3	Credit Based Methods	108
3.10.4	Some Comments on the Environmental Assessment Methods for Buildings	113
3.10.5	Incorporating the LCA Methods into the Credit Based Methods	114
3.11	Environmentally Compatible Structural Materials (ESCM) - European Experience	118
3.11.1	Environmental Aspects of Materials	118
3.11.2	Wood - Timber	120
3.11.3	Natural Stones	122
3.11.4	Clay Products - Ceramics	123
3.11.5	Binders	124

3.11.6	Concrete	125
3.11.7	Mortar and Plaster	126
3.11.8	Autoclaved Masonry Elements	126
3.11.9	Metals	127
3.11.10	Glass	128
3.11.11	Insulation Materials	128
3.11.12	Covering and Cladding Materials	131
3.11.13	Plastic	131
3.11.14	Bitumen	133
3.11.15	Natural Materials	133
3.11.16	Indicators of Material Production	134
3.12	Environmentally Compatible Structural Materials (ESCM) - Canadian Experience	136
3.12.1	Introduction	136
3.12.2	Embedded Energy of Common Structural Materials	137
3.12.3	Embodied Energy and Effectiveness of Materials	140
3.12.4	Greenhouse Gas and Structural Materials	141
3.12.5	Greenhouse Gas and Effectiveness of Materials	142
3.12.6	Embedded Energy and Thermal Efficiency	142
3.12.7	Greenhouse Gas and Thermal Efficiency	143
3.12.8	Multi Functional Materials and Assemblies	143
3.12.9	Whole Life Environmental Impact	143
3.12.10	Materials Selection and the Quality of Life	144
3.12.11	Conclusion	145
3.13	Design of Environmentally Compatible Structures with Regard to Accidental Fires	145
3.13.1	How to Design Environmentally Compatible Structures with Regard to Accidental Fires?	145
3.13.2	Analysis of Fires and Fire Scenarios in Relation to ECS	147
3.13.3	Toxic Products and Environmental Pollution Released during a Fire	150
3.13.4	Principles for Application of Building Materials in Load-bearing Environmentally Compatible Structures (ECS)	152
3.13.5	How to Protect Building Structures from Accidental Fire. Environmental Effects of Fire	155
3.13.6	Fire-Suppressing Board Lining	158
3.13.7	Glued Linings of Mineral Fibers	161
3.14	References	161

4	ENVIRONMENTALLY COMPATIBLE BRIDGE AND HYDRAULIC STRUCTURES	166
4.1	Environmentally Compatible Bridge Structures	166
4.1.1	Traditional Design of Bridges and the Way to ECS	166
4.1.2	Selecting of Bridge Structures Considering Environmental Compatibility	167
4.1.3	Some Important Aspects of Environmentally Compatible Bridges	177
4.1.4	Conclusion to EC Bridges	191
4.2	EC Hydraulic Structures	192
4.2.1	Introduction	192
4.2.2	Fundamental Differences between the Classic Design Procedure of River Hydraulic Structures and the Design Procedure of ECS	196
4.2.3	EC Design Procedures	198
4.2.4	Global Lasting Dynamic Equilibrium	198
4.2.5	Dam Service Life	200
4.2.6	Exploitation of Natural Resources in Dam Construction	201
4.2.7	Embankment Dams	201
4.2.8	Concrete Dams	203
4.2.9	Demands for Concrete in Massive Dams with Gravity Effect	203
4.2.10	Overflow, Outlet and Intake Dam Structures	207
4.2.11	Physically Defined Surfaces in Hydraulic Engineering	207
4.2.12	Examples	209
4.2.13	Summary and Recommendations	215
4.3	References	216
5	CASE STUDIES OF ECS	219
5.1	Environmentally Compatible Structures in Canada	219
5.1.1	Buildings in Canada	219
5.1.2	Characteristics of Three Structural Systems Commonly Used in Canada	220
5.1.3	Comments on the Environmental Compatibility of Systems A, B and C	224
5.1.4	Examples of LEED Buildings	226
5.2	Environmentally Compatible Structures in Japan	229
5.2.1	The Characteristics of Environmentally Compatible Structures in Japan	229
5.2.2	The Current Techniques for ECS Construction in Japan	230
5.2.3	The Assessment Methods of ECS Techniques in Japan: CASBEE	231
5.2.4	Examples of Environmentally Compatible Structures in Japan [11]	232
5.2.5	Concluding Remarks	237
5.3	References	238

6	SELECTED TERMINOLOGY	239
6.1	Environment vs. Ecology	239
6.2	Primary Energy	239
6.3	Environment, Applied Environmental Sciences, One and Two-way Environmental Effects	239
6.4	Ecology	240
6.5	Environmental Pollution	241
6.6	Environmental Protection - Clean Environment	241
6.7	Natural and Man-built Ecosystems	242
6.8	Environmental Engineering	242
6.9	Environmental Sustainability (in Short ES)	243
6.10	Environmentally Compatible Structure (in Short ECS)	244
6.11	Equilibrium Condition in Nature (Homeostasis)	245
6.12	Primary and Secondary Structures	245
6.13	Low Energy, Passive Energy, or Zero Energy Buildings	246
6.14	Durability, Life-span, Life-cycle (LS)	246
6.15	Engineering (in Short E_gO) and Environmental (E_nO) Optimization Methods	247
6.16	Environmental Impact Assessment (in Short EIA)	247
6.17	Equivalent Slab Depth (d_s) as a Design Characteristic	248
6.18	Harmful Greenhouse Gas Emissions	248
6.19	Raw Material Resources	249
6.20	Greenhouse Effect	249
6.21	Alternative Power Resources	250
6.22	Renewable and Non-renewable Structural Material Resources	250
6.23	Population Growth in View of the Theory of ECS	250
6.24	Population Growth in View of the Theory of ECS	251
6.25	Design Characteristics of ECS (in Short DCH or DC)	251
6.26	Factors of Sustainability (in Short FS)	251
6.27	Building Experience of Nature	251
6.28	References	252
7	SELECTED BIBLIOGRAPHY	253
	AUTHOR LIST	262
