

CONTENTS

1	INTEGRATED DESIGN OF STRUCTURES AND SYSTEMS FOR CONSTRUCTION
1.1	Theoretical bases of integrated design
1.1.1	Detailed processing of life cycle assessment (LCA) and its costs (LCC) methodology
1.1.1.3	Specific methodology application for structures with various characters
1.1.1.3-5	Connecting application tools to the RTS database
1.1.2	Risk and reliability analyses development as tool for qualified decision-making
1.1.2.2	Methods and software for reliability analysis and assessment of technical and economical risks
1.1.2.2-19	DDFPM optimizing methods
1.1.2.2-20	Using risk analysis to determine the damage-to-assessed-building-structure ratio
1.1.2.2-21	Risk analysis development for the tunnel excavation process
1.1.2.2-22	Modelling of successive tunnel excavation with the use of convergence measurements
1.1.2.2-23	Dynamic experiment of a cantilever beam made of timber
1.1.2.3	SBRA as a tool for fully probabilistic assessment of reliability of structures
1.1.2.3-8	Design and assessment of structural reliability based on the SBRA method in terms of serviceability criteria
1.1.3	Methods of structural design stressing durability and reliability
1.1.3.1	Methods of structural design for specific levels of reliability and service life; applications
1.1.3.1-15	Probabilistic approach to the propagation of surface cracks and creation of weakened areas
1.1.3.1-16	Implementation of a concrete constitutive model for tasks of automated 2D structural analysis
1.1.3.1-17	Asynchronously updated probabilistic cellular automata in degradation evolution models
1.1.3.1-18	Performance-based specification of concrete
1.1.3.2	Degradation models; assessment of material imperfections and technological effects; applications
1.1.3.2-23	Mortar rehydration after heating to temperatures up to 1200°C
1.1.3.2-24	The influence of silicate admixtures on the content of calcium hydroxide in cement paste
1.1.3.2-25	Pore structure in the surface layer of concrete with respect to different finishing – other types of surface
1.2	Methodology for design, construction and management of building structures
1.2.1	Energy and material-efficient structures of buildings
1.2.1.1	Construction and energy concept of integrated design of buildings
1.2.1.1-7	Airtightness measurements of buildings and analysis of test results
1.2.1.2	Multicriterion analysis and experimental verification of structural elements and building structures made from high performance and recycled materials and integrated elements
1.2.1.2-12	Experimental verification of a balcony railing section from fibre reinforced cementitious composites
1.2.1.2-13	Experimental verification of waffle floor segments from fibre concrete
1.2.1.3	Computational methods for simulation of energy systems based on renewable energy sources
1.2.1.3-5	Integrated model for building simulations in MATLAB and SIMULINK
1.2.2	Application of complex approaches to LCA and LCC within the building's management
1.2.2.1	Complex methods for life cycle assessment (LCA) and life cycle cost (LCC) analysis, multicriterion optimization and buildings quality assessment
1.2.2.1-6	SBTOOL CZ - methodology
1.2.2.1-7	Methodology of life cycle assessment (LCA) of reinforced-concrete floor structures
1.2.2.3	Application software for assessment of complex quality of buildings within their life cycle
1.2.2.3-4	Advanced tools for assessing and streamlining comprehensive building quality
1.2.3	Management and maintenance of buildings in territories with intensive industrial activities
1.2.3.1	General building, energy, technical, and operation concepts and possible use of the buildings for new purposes in regenerated brownfields

- 1.2.3.1-6 **Building, energy, technology and operation concepts for buildings in industrial zones - source data for drafting a regulation**
- 1.2.3.1a-5 **Structural adaptations improving airborne transmission losses in inter-apartment walls and separating walls**
- 1.2.3.2 Multi-criterion decision-making about usability of buildings in territories with intensive industrial activities
- 1.2.3.2-4 **Using multi-criterion analysis for the assessment of energy performance of buildings on territories with increased industrial activities**
- 1.3 The concepts of design, construction and management of roads and airports
- 1.3.1 Compilation of a methodology (guidelines) for designing and creating advanced road structures
 - 1.3.1.1 Analysis of road network bearing capacities
 - 1.3.1.1-5 **Traffic load on selected multilane roundabouts in the Czech Republic**
 - 1.3.1.2 Specification and research of innovative materials for pavement construction and reconstruction
 - 1.3.1.2-11 **Initial design of innovative asphalt mixes for long-life pavements**
 - 1.3.1.2-12 **Stiffness modulus and characteristics in a low temperature range for selected WMA mixes**
 - 1.3.1.2-13 **Measurement of selected properties of bitumen and asphalt mixtures**
 - 1.3.1.3 Optimization of pavement design (including determination of parameters for the application of the innovative materials and technologies)
 - 1.3.1.3-16 **Design of pavement constructions using open rubber-asphalt toppings and asphalt layers reducing noise**
 - 1.3.1.3-17 **Implementation of selected factors into a 3D model of cement pavement– joint effect**
 - 1.3.1.3-18 **The use of the triaxial compression test**
 - 1.3.1.3-19 **Calibration and implementation of the macroscopic model of asphalt**
 - 1.3.2 Analysis of models for pavement construction and road development management
 - 1.3.2.2 Systemic model for the conversion of diagnostic and statistical data for the analysis of road infrastructure according to the methodology HDM-4
 - 1.3.2.2-4 **VYNAPA – design parameters calculation software**
 - 1.3.2.3 Analysis of existing knowledge of models for road infrastructure funding
 - 1.3.2.3-4 **Prerequisites and criteria for applying a modern asset management system to road infrastructure**
 - 1.3.3 Proposal of procedures for the construction and maintenance of roads in areas exposed to mining activities
 - 1.3.3.2 Concept of the proposal of construction and maintenance of roads in areas exposed to mining activities
 - 1.3.3.2-7 **Methods for land survey monitoring of Armovia**
 - 1.3.3.2-8 **Planning of repairs and maintenance on undermined territories**
 - 1.4 Development of theoretical basis for design, construction and management of bridges
 - 1.4.1 Development of methods of reliable prediction of behaviour of bridges, their durability and life cycle
 - 1.4.1.1 Diagnostics of bridges, investigation of cause of faults with respect to functionality, serviceability and load-bearing capacity. Investigation of cause of degradation of bridges.
 - 1.4.1.1-4 **The influence of the machined surface of reinforcement on the dispersion of its strength values measured by PROCEQ hardness tester**
 - 1.4.1.2 Theoretical analysis, prediction of long-term behaviour. New computational models. Prognostication of degradation process.
 - 1.4.1.2-4 **The distortional and warping effect as a significant factor affecting the behaviour of girder structures**
 - 1.4.1.3 Reliability of long-term action prognosis, degradation, models testing, corrections and evaluations
 - 1.4.1.3-2 **Updating degradation assessment of concrete structures by in-situ measured data**
 - 1.4.2 Detailing of BMS and of new planning trends in the range of bridge management
 - 1.4.2.1 Optimization of cost of construction of new bridges and repairs of existing bridges
 - 1.4.2.1-4 **Experimental verification of structural action of integral bridges**
 - 1.4.2.2 Prognosis of financial resources needs for repairs for next five years
 - 1.4.2.2-4 **Prognosis of demands for maintenance, repairs and reconstruction of a bridge structure**
