UNIT 1

BASIC CELL PROCESSES: Integration and Coordination

1 Introduction to Physiology	1
• Physiological Systems	2
• Function and Process	3
• Homeostasis	3
• Physiology: Moving Beyond the Genome	6
• Physiology Is an Integrative Science	6
• Themes in Physiology	7
 <i>Focus on ... Mapping</i>	8
• The Science of Physiology	9
• Good Scientific Experiments Must Be Carefully Designed	9
• The Results of Human Experiments Can Be Difficult to Interpret	10
• Human Studies Can Take Many Forms	11
 <i>Focus on ... Graphs</i>	12
• Searching and Reading the Scientific Literature	14
Chapter Summary	15
Questions	16
Answers	18
2 Molecular Interactions	19
 <i>Running Problem: Chromium Supplements</i>	20
• Chemistry Review	20
• Atoms Are Composed of Protons, Neutrons, and Electrons	20
• The Number of Protons in the Nucleus Determines the Element	21
• Isotopes of an Element Contain Different Numbers of Neutrons	21
• Electrons Form Bonds Between Atoms and Capture Energy	22
• Molecular Bonds and Shapes	23
• Covalent Bonds Are Formed When Adjacent Atoms Share Electrons	23
• Ionic Bonds Are Formed When Atoms Gain or Lose Electrons	24

• Hydrogen Bonds and Van der Waal Forces Are Weak Interactions Between Atoms	25
• Molecular Shape Is Related to Molecular Function	26
• Biomolecules	27
• Carbohydrates Are the Most Abundant Biomolecules	27
• Lipids Are Structurally the Most Diverse Biomolecules	27
• Proteins Are the Most Versatile Biomolecules	30
• Some Molecules Combine Carbohydrates, Proteins, and Lipids	32
• Nucleotides Transmit and Store Energy and Information	32
• Aqueous Solutions, Acids, Bases, and Buffers	35
• Not All Molecules Dissolve in Aqueous Solutions	35
• There Are Several Ways to Express the Concentration of a Solution	35
• The Concentration of Hydrogen Ions in the Body Is Expressed in pH Units	37
• Protein Interactions	38
• Proteins Are Selective About the Molecules They Bind	39
• Multiple Factors Can Alter Protein Binding	40
• Modulation Alters Protein Binding and Activity	40
• Physical Factors Modulate or Inactivate Proteins	42
• The Body Regulates the Amount of Protein Present in Cells	43
• Reaction Rate Can Reach a Maximum	43
Chapter Summary	45
Questions	47
Answers	49
3 Compartmentation: Cells and Tissues	50
 <i>Running Problem: The Pap Smear</i>	51
• Functional Compartments of the Body	51
• The Lumens of Hollow Organs Are Not Part of the Internal Environment	51
• Functionally, the Body Has Three Fluid Compartments	52
• Biological Membranes	53

• The Cell Membrane Separates the Cell from Its Environment	53
• Membranes Are Mostly Lipid and Protein	53
 <i>Biotechnology: Liposomes for Beauty and Health</i>	55
• Membrane Lipids Form a Barrier Between the Cytoplasm and Extracellular Fluid	55
• Membrane Proteins May Be Loosely or Tightly Bound to the Membrane	55
• Membrane Carbohydrates Attach to Both Lipids and Proteins	58
• Intracellular Compartments	58
• Cells Are Divided into Compartments	59
• The Cytoplasm Includes the Cytosol, Inclusions, and Organelles	61
• Inclusions Are in Direct Contact with the Cytosol	61
• Cytoplasmic Protein Fibers Come in Three Sizes	61
• Microtubules Form Centrioles, Cilia, and Flagella	61
• The Cytoskeleton Is a Changeable Scaffold	62
• Motor Proteins Create Movement	63
• Organelles Create Compartments for Specialized Functions	64
• The Nucleus Is the Cell's Control Center	67
• Tissues of the Body	68
• Extracellular Matrix Has Many Functions	68
• Cell Junctions Hold Cells Together to Form Tissues	69
• Epithelia Provide Protection and Regulate Exchange	72
• Connective Tissues Provide Support and Barriers	76
 <i>Biotechnology: Growing New Cartilage</i>	77
• Muscle and Neural Tissues Are Excitable	80
• Tissue Remodeling	81
• Apoptosis Is a Tidy Form of Cell Death	81
• Stem Cells Can Create New Specialized Cells	81
• Organs	82
 <i>Focus on ... the Skin</i>	83
Chapter Summary	85
Questions	86
Answers	88
4 Energy and Cellular Metabolism	89
 <i>Running Problem: Tay-Sachs Disease</i>	90
• Energy in Biological Systems	90
• Energy Is Used to Perform Work	91
• Energy Comes in Two Forms: Kinetic and Potential	92
• Energy Can Be Converted from One Form to Another	92
• Thermodynamics Is the Study of Energy Use	93
• Chemical Reactions	93
• Energy Is Transferred Between Molecules During Reactions	93
• Activation Energy Gets Reactions Started	94
• Energy Is Trapped or Released During Reactions	94
• Net Free Energy Change Determines Reaction Reversibility	95
• Enzymes	96
• Enzymes Take Part in Typical Protein Interactions	96
• Enzymes May Be Activated, Inactivated, or Modulated	97
 <i>Biotechnology: Separation of Isozymes by Electrophoresis</i>	97
• Enzymes Lower the Activation Energy of Reactions	98
• Reaction Rates Are Variable	98
• Reversible Reactions Obey the Law of Mass Action	99
• Enzymatic Reactions Can Be Categorized	99
• Metabolism	101
• Cells Regulate Their Metabolic Pathways	101
• ATP Transfers Energy Between Reactions	103
• ATP Production	103
• Glycolysis Converts Glucose and Glycogen into Pyruvate	104
• Anaerobic Metabolism Converts Pyruvate into Lactate	106
• Pyruvate Enters the Citric Acid Cycle in Aerobic Metabolism	107
• The Electron Transport System Transfers Energy from NADH and FADH ₂ to ATP	108
• ATP Synthesis Is Coupled to Hydrogen Ion Movement	109
• The Maximum Energy Yield of One Glucose Molecule Is 30–32 ATP	110
• Large Biomolecules Can Be Used to Make ATP	110
• Synthetic Pathways	112
• Glycogen Can Be Made from Glucose	112
• Glucose Can Be Made from Glycerol or Amino Acids	112
• Acetyl CoA Is an Important Precursor for Lipid Synthesis	113
• Proteins Are the Key to Cell Function	113
 <i>Clinical Focus: Energy and Exercise</i>	113
 <i>Clinical Focus: Insulin and Metabolism</i>	115

• Translating DNA to Protein Is a Complex Process	115
• During Translation, DNA Guides the Synthesis of a Complementary mRNA Molecule	115
• Alternative Splicing Creates Multiple Proteins from One Sequence of DNA	118
 <i>Emerging Concepts: RNA Interference</i>	118
• Translation of mRNA Produces a String of Amino Acids	118
• Protein Sorting Directs Proteins to Their Destination	119
• Final Protein Structure Is Determined by Post-Translational Modification	120
• Proteins Made on the Endoplasmic Reticulum Enter the Secretory Pathway	122
Chapter Summary	123
Questions	125
Answers	126

5 Membrane Dynamics

 <i>Running Problem: Cystic Fibrosis</i>	129
• Mass Balance and Homeostasis	129
• Excretion Clears Substances from the Body	130
• Homeostasis Does Not Mean Equilibrium	130
• Diffusion	132
• Diffusion Uses Only the Energy of Molecular Movement	133
• Lipophilic Molecules Can Diffuse Through the Phospholipid Bilayer	135
• Protein-Mediated Transport	136
• Membrane Proteins Function as Structural Proteins, Enzymes, Receptors, and Transporters	137
• Channel Proteins Form Open, Water-Filled Passageways	138
• Carrier Proteins Change Conformation to Move Molecules	139
• Facilitated Diffusion Uses Carrier Proteins	141
• Active Transport Moves Substances Against Their Concentration Gradients	142
• Carrier-Mediated Transport Exhibits Specificity, Competition, and Saturation	145
• Vesicular Transport	148
• Phagocytosis Creates Vesicles Using the Cytoskeleton	148
• Endocytosis Creates Smaller Vesicles	148
• Exocytosis Releases Molecules Too Large for Transport Proteins	150
 <i>Clinical Focus: The Lethal Lipoprotein</i>	150

• Transepithelial Transport	150
• Transepithelial Transport of Glucose Uses Membrane Proteins	152
• Transcytosis Uses Vesicles to Cross an Epithelium	153
• Osmosis and Tonicity	153
• The Body Is Mostly Water	154
 <i>Clinical Focus: Estimating Body Water</i>	154
• The Body Is in Osmotic Equilibrium	154
• Osmolarity Describes the Number of Particles in Solution	155
• Tonicity of a Solution Describes the Volume Change of a Cell Placed in that Solution	157
• The Resting Membrane Potential	160
• The Cell Membrane Enables Separation of Electrical Charge in the Body	161
• The Resting Membrane Potential Is Due Mostly to Potassium	162
• Changes in Ion Permeability Change the Membrane Potential	165
• Integrated Membrane Processes: Insulin Secretion	166
Chapter Summary	169
Questions	170
Answers	172

6 Communication, Integration, and Homeostasis

 <i>Running Problem: Diabetes Mellitus</i>	175
• Cell-to-Cell Communication	175
• Gap Junctions Create Cytoplasmic Bridges	175
• Contact-Dependent Signals Require Cell-to-Cell Contact	176
• Paracrine and Autocrine Signals Carry Out Local Communication	176
• Neural Signals, Hormones, and Neurohormones Carry Out Long-Distance Communication	176
• Cytokines May Act as Both Local and Long-Distance Signals	176
• Signal Pathways	177
• Receptor Proteins Are Located Inside the Cell or on the Cell Membrane	178
• Membrane Proteins Facilitate Signal Transduction	180
• Receptor-Enzymes Have Protein Kinase or Guanylyl Cyclase Activity	182
 <i>Clinical Focus: Insulin's Signal Transduction Pathway</i>	183
• Most Signal Transduction Uses G Proteins	183

• Adenylyl Cyclase-cAMP Is the Signal Transduction System for Many Lipophobic Hormones	183
• G Protein-Linked Receptors Also Use Lipid-Derived Second Messengers	184
• Integrin Receptors Transfer Information from the Extracellular Matrix	184
• The Most Rapid Signal Pathways Change Ion Flow Through Channels	185
• Novel Signal Molecules	186
• Calcium Is an Important Intracellular Signal	186
• Gases Are Ephemeral Signal Molecules	187
 <i>Biotechnology: Measuring Calcium Signals</i>	188
• Some Lipids Are Important Paracrine Signals	188
• Modulation of Signal Pathways	189
• Receptors Exhibit Saturation, Specificity, and Competition	189
• Up-Regulation and Down-Regulation Enable Cells to Modulate Responses	190
• Cells Must Be Able to Terminate Signal Pathways	191
• Many Diseases and Drugs Target the Proteins of Signal Transduction	191
• Control Pathways: Response and Feedback Loops	191
• Cannon's Postulates Describe Regulated Variables and Physiological Control Systems	192
• Homeostasis May Be Maintained by Local or Long-Distance Pathways	194
• Response Loops Begin with a Stimulus and End with a Response	197
• Setpoints Can Be Varied	198
• Feedback Loops Modulate the Response Loop	199
• Feedforward Control Allows the Body to Anticipate Change and Maintain Stability	200
• Biological Rhythms Result from Changes in a Setpoint	200
• Control Systems Vary in Their Speed and Specificity	202
• Complex Reflexes Have Several Integrating Centers	203
Chapter Summary	207
Questions	208
Answers	209

UNIT 2

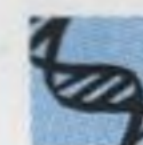

HOMEOSTASIS AND CONTROL

7 Introduction to the Endocrine System	211
 <i>Running Problem: Graves' Disease</i>	212

• Hormones	212
• Hormones Have Been Known Since Ancient Times	212
• What Makes a Chemical a Hormone?	213
 <i>Clinical Focus: The Discovery of Insulin</i>	213
 <i>Biotechnology: Immunocytochemistry</i>	216
• Hormones Act by Binding to Receptors	217
• Hormone Action Must Be Terminated	217
• The Classification of Hormones	217
• Most Hormones Are Peptides or Proteins	217
• Steroid Hormones Are Derived from Cholesterol	219
• Amine Hormones Are Derived from One of Two Amino Acids	222
• Control of Hormone Release	222
• Hormones Can Be Classified by Their Reflex Pathways	222
• The Endocrine Cell Is the Sensor in the Simplest Endocrine Reflexes	223
• Many Endocrine Reflexes Involve the Nervous System	225
• Neurohormones Are Secreted into the Blood by Neurons	225
• The Pituitary Gland Is Actually Two Fused Glands	225
• The Posterior Pituitary Stores and Releases Two Neurohormones	226
• The Anterior Pituitary Secretes Six Hormones	226
• Feedback Loops Are Different in the Hypothalamic-Pituitary Pathway	227
• The Hypothalamic-Hypophyseal Portal System Directs Trophic Hormone Delivery	229
• Anterior Pituitary Hormones Control Growth, Metabolism, and Reproduction	229
• Hormone Interactions	230
• In Synergism, the Effect of Interacting Hormones Is More Than Additive	230
• A Permissive Hormone Allows Another Hormone to Exert Its Full Effect	231
• Antagonistic Hormones Have Opposing Effects	232
• Endocrine Pathologies	232
• Hypersecretion Exaggerates a Hormone's Effects	232
• Hyposecretion Diminishes or Eliminates a Hormone's Effects	233
• Receptor or Second Messenger Problems Cause Abnormal Tissue Responsiveness	233
• Diagnosis of Endocrine Pathologies Depends on the Complexity of the Reflex	234

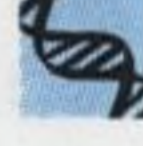

• Hormone Evolution	235
 <i>Focus on ... the Pineal Gland</i>	237
Chapter Summary	239
Questions	240
Answers	241

8 Neurons: Cellular and Network Properties

 <i>Running Problem: Mysterious Paralysis</i>	244
• Organization of the Nervous System	245
• Cells of the Nervous System	246
• Neurons Are Excitable Cells That Generate and Carry Electrical Signals	246
• Glial Cells Are the Support Cells of the Nervous System	250
• Electrical Signals in Neurons	252
• The Nernst Equation Predicts Membrane Potential for a Single Ion	252
• The GHK Equation Predicts Membrane Potential Using Multiple Ions	252
• Ion Movement Across the Cell Membrane Creates Electrical Signals	253
• Gated Channels Control the Ion Permeability of the Neuron	254
• Changes in the Channel Permeability Create Electrical Signals	254
 <i>Clinical Focus: Channelopathies</i>	254
• Graded Potentials Reflect the Strength of the Stimulus That Initiates Them	255
• Action Potentials Travel Long Distances Without Losing Strength	257
• Action Potentials Represent Movement of Na ⁺ and K ⁺ Across the Membrane	258
• Na ⁺ Channels in the Axon Have Two Gates	259
• Action Potentials Will Not Fire During the Absolute Refractory Period	260
• Stimulus Intensity Is Coded by the Frequency of Action Potentials	261
• One Action Potential Does Not Alter Ion Concentration Gradients	261
• Action Potentials Are Conducted from the Trigger Zone to the Axon Terminal	263
• Larger Neurons Conduct Action Potentials Faster	266
• Conduction Is Faster in Myelinated Axons	266
 <i>Biotechnology: Mutant Mouse Models</i>	268
• Electrical Activity Can Be Altered by a Variety of Chemical Factors	269
 <i>Biotechnology: Of Snakes, Snails, Spiders, and Sushi</i>	270

• Cell-to-Cell Communication in the Nervous System	270
• Information Passes from Cell to Cell at the Synapse	270
• Calcium Is the Signal for Neurotransmitter Release at the Synapse	271
• Neurocrines Convey Information from Neurons to Other Cells	272
 <i>Emerging Concepts: Synaptic Vesicles Kiss and Run</i>	272
• The Nervous System Secretes a Variety of Neurocrines	272
 <i>Clinical Focus: Myasthenia Gravis</i>	274
• Multiple Receptor Types Amplify the Effects of Neurotransmitters	275
• Not All Postsynaptic Responses Are Rapid and of Short Duration	277
• Neurotransmitter Activity Is Rapidly Terminated	277
• Integration of Neural Information Transfer	278
• Neural Pathways May Involve Many Neurons Simultaneously	278
• Synaptic Activity Can Also Be Modulated at the Axon Terminal	279
• Long-Term Potentiation Alters Synaptic Communication	281
• Disorders of Synaptic Transmission Are Responsible for Many Diseases	282
• Development of the Nervous System Depends on Chemical Signals	283
• When Neurons Are Injured, Segments Separated from the Cell Body Die	283
Chapter Summary	286
Questions	287
Answers	289

9 The Central Nervous System

 <i>Running Problem: Infantile Spasms</i>	292
• Emergent Properties of Neural Networks	292
• Evolution of Nervous Systems	292
• Anatomy of the Central Nervous System	294
 <i>Biotechnology: Tracing Neurons in a Network</i>	294
• The Central Nervous System Develops from a Hollow Tube	295
• The Central Nervous System Is Divided into Gray Matter and White Matter	296
• Bone and Connective Tissue Support the Central Nervous System	296
• The Brain Floats in Cerebrospinal Fluid	296

• The Blood-Brain Barrier Protects the Brain from Harmful Substances in the Blood	299
• Neural Tissue Has Special Metabolic Requirements	300
 <i>Clinical Focus: Hypoglycemia and the Brain</i>	301
• The Spinal Cord	301
• The Brain	302
• The Brain Stem Is the Transition Between Spinal Cord and Midbrain	303
• The Brain Stem Consists of Medulla, Pons, and Midbrain	305
• The Cerebellum Coordinates Movement	305
• The Diencephalon Contains the Centers for Homeostasis	306
• The Cerebrum Is the Site of Higher Brain Functions	307
• The Cerebrum Has Distinct Regions of Gray Matter and White Matter	307
• Brain Function	308
• The Cerebral Cortex Is Organized into Functional Areas	309
• Sensory Information Is Integrated in the Spinal Cord and Brain	310
• Sensory Information Is Processed into Perception	311
• The Motor System Governs Output from the Central Nervous System	311
• The Behavioral State System Modulates Motor Output	312
• The Reticular Activating System Influences States of Arousal	312
• Why Do We Sleep?	313
 <i>Emerging Concepts: Adenosine and That “Java Jolt”</i>	315
• Physiological Functions Exhibit Circadian Rhythms	315
• Emotion and Motivation Involve Complex Neural Pathways	315
• Moods Are Long-Lasting Emotional States	316
• Learning and Memory Change Synaptic Connections in the Brain	317
• Learning Is the Acquisition of Knowledge	317
• Memory Is the Ability to Retain and Recall Information	318
• Language Is the Most Elaborate Cognitive Behavior	320
• Personality Is a Combination of Experience and Inheritance	321
Chapter Summary	323
Questions	324
Answers	326

10 Sensory Physiology	327
 <i>Running Problem: Ménière’s Disease</i>	328
• General Properties of Sensory Systems	328
• Receptors Are Sensitive to Particular Forms of Energy	329
• Sensory Transduction Converts Stimuli into Graded Potentials	330
• A Sensory Neuron Has a Receptive Field	330
• The Central Nervous System Integrates Sensory Information	331
• Coding and Processing Distinguish Stimulus Modality, Location, Intensity, and Duration	332
• Somatic Senses	337
• Pathways for Somatic Perception Project to the Somatosensory Cortex and Cerebellum	337
• Touch Receptors Respond to Many Different Stimuli	338
• Temperature Receptors Are Free Nerve Endings	339
• Nociceptors Initiate Protective Responses	340
• Pain and Itching Are Mediated by Nociceptors	340
 <i>Clinical Focus: Natural Pain-Killers</i>	343
• Chemoreception: Smell and Taste	343
• Olfaction Is One of the Oldest Senses	343
• Taste Is a Combination of Five Basic Sensations	345
• The Ear: Hearing	347
• Hearing Is Our Perception of Sound	349
• Sound Transduction Is a Multistep Process	349
• The Cochlea Is Filled with Fluid	350
• Sounds Are Processed First in the Cochlea	353
• Auditory Pathways Project to the Auditory Cortex	353
• Hearing Loss May Result from Mechanical or Neural Damage	354
 <i>Biotechnology: Cochlear Implants</i>	354
• The Ear: Equilibrium	355
• The Vestibular Apparatus Is Filled with Endolymph	355
• The Vestibular Apparatus Provides Information About Movement and Position in Space	355
• The Semicircular Canals Sense Rotational Acceleration	355
• The Otolith Organs Sense Linear Acceleration and Head Position	355
• Equilibrium Pathways Project Primarily to the Cerebellum	357
• The Eye and Vision	358
 <i>Clinical Focus: Glaucoma</i>	358

• The Eye Is Protected by the Skull	358
• Light Enters the Eye Through the Pupil	360
• The Lens Focuses Light on the Retina	361
• Phototransduction Occurs at the Retina	364
• Photoreceptors Transduce Light into Electrical Signals	366
• Signal Processing Begins in the Retina	369
 <i>Emerging Concepts: Melanopsin—A New Photosensitive Pigment</i>	370
Chapter Summary	372
Questions	373
Answers	374

11 Efferent Division: Autonomic and Somatic Motor Control

 <i>Running Problem: A Powerful Addiction</i>	377
• The Autonomic Division	377
• Autonomic Reflexes Are Important for Homeostasis	378
• Antagonistic Control Is a Hallmark of the Autonomic Division	379
• Autonomic Pathways Have Two Efferent Neurons in Series	379
• Sympathetic and Parasympathetic Branches Exit the Spinal Cord in Different Regions	381
• The Autonomic Nervous System Uses a Variety of Neurotransmitters and Modulators	382
• Autonomic Pathways Control Smooth and Cardiac Muscle, Glands, and Lymphoid and Adipose Tissues	382
• Autonomic Neurotransmitters Are Synthesized in the Axon	383
• Most Sympathetic Pathways Secrete Norepinephrine onto Adrenergic Receptors	383
• The Adrenal Medulla Secretes Catecholamines	385
• Parasympathetic Pathways Secrete Acetylcholine onto Muscarinic Receptors	386
• Autonomic Agonists and Antagonists Are Important Tools in Research and Medicine	386
• Primary Disorders of the Autonomic Nervous System Are Relatively Uncommon	387
 <i>Clinical Focus: Autonomic Neuropathy</i>	387
• Summary of Sympathetic and Parasympathetic Branches	387
• The Somatic Motor Division	389
• A Somatic Motor Pathway Consists of One Neuron	390
• The Neuromuscular Junction Contains Nicotinic Receptors	391

Chapter Summary	393
Questions	393
Answers	395

12 Muscles

 <i>Running Problem: Periodic Paralysis</i>	397
• Skeletal Muscle	398
• Skeletal Muscles Are Composed of Muscle Fibers	398
• Myofibrils Are the Contractile Structures of a Muscle Fiber	399
• Muscle Contraction Creates Force	402
• Muscles Shorten When They Contract	403
• Contraction Is Regulated by Troponin and Tropomyosin	406
• Acetylcholine Initiates Excitation-Contraction Coupling	407
 <i>Biotechnology: The In Vitro Motility Assay</i>	407
• Skeletal Muscle Contraction Requires a Steady Supply of ATP	410
• Muscle Fatigue Has Multiple Causes	411
• Skeletal Muscle Fibers Are Classified by Contraction Speed and Resistance to Fatigue	412
• Tension Developed by Individual Muscle Fibers Is a Function of Fiber Length	413
• Force of Contraction Increases with Summation of Muscle Twitches	413
• A Motor Unit Is One Somatic Motor Neuron and the Muscle Fibers It Innervates	415
• Contraction in Intact Muscles Depends on the Types and Numbers of Motor Units	416
• Mechanics of Body Movement	417
• Isotonic Contractions Move Loads, but Isometric Contractions Create Force Without Movement	417
• Bones and Muscles Around Joints Form Levers and Fulcrums	417
• Muscle Disorders Have Multiple Causes	420
• Smooth Muscle	421
• Smooth Muscles Are Much Smaller than Skeletal Muscle Fibers	422
 <i>Clinical Focus: Smooth Muscle and Atherosclerosis</i>	422
• Smooth Muscle Has Longer Actin and Myosin Filaments	423
• Smooth Muscle Contractile Filaments are Not Arranged in Sarcomeres	424
• Phosphorylation of Proteins Plays a Key Role in Smooth Muscle Contraction	425
• Relaxation in Smooth Muscle Has Several Steps	426

• Calcium Entry Is the Signal for Smooth Muscle Contraction	426
• Muscle Stretch Opens Ca^{2+} Channels	427
• Some Smooth Muscles Have Unstable Membrane Potentials	427
• Smooth Muscle Activity Is Regulated by Chemical Signals	428
• Cardiac Muscle	429
Chapter Summary	430
Questions	432
Answers	434

13 Integrative Physiology I: Control of Body Movement

 <i>Running Problem: Tetanus</i>	436
• Neural Reflexes	436
• Neural Reflex Pathways Can Be Classified in Different Ways	436
• Autonomic Reflexes	437
 <i>Emerging Concepts: Visualization Techniques in Sports</i>	438
• Skeletal Muscle Reflexes	439
• Muscle Spindles Respond to Muscle Stretch	439
• Golgi Tendon Organs Respond to Muscle Tension	442
• Stretch Reflexes and Reciprocal Inhibition Control Movement Around a Joint	443
 <i>Clinical Focus: Reflexes and Muscle Tone</i>	443
• Flexion Reflexes Pull Limbs Away from Painful Stimuli	444
• The Integrated Control of Body Movement	445
• Movement Can Be Classified as Reflex, Voluntary, or Rhythmic	446
 <i>Emerging Concepts: Central Pattern Generators and Spinal Cord Injuries</i>	448
• The CNS Integrates Movement	448
• Symptoms of Parkinson's Disease Reflect the Functions of the Basal Ganglia	450
• Control of Movement in Visceral Muscles	451
Chapter Summary	453
Questions	454
Answers	455

UNIT 3

INTEGRATION OF FUNCTION

14 Cardiovascular Physiology	456
 <i>Running Problem: Myocardial Infarction</i>	457

• Overview of the Cardiovascular System	457
• The Cardiovascular System Transports Materials Throughout the Body	458
• The Cardiovascular System Consists of the Heart, Blood Vessels, and Blood	458
• Pressure, Volume, Flow, and Resistance	460
• The Pressure of Fluid in Motion Decreases over Distance	461
• Pressure Changes in Liquids Without a Change in Volume	462
• Blood Flows from an Area of Higher Pressure to One of Lower Pressure	462
• Resistance Opposes Flow	462
• Velocity of Flow Depends on the Flow Rate and the Cross-Sectional Area	464
• Cardiac Muscle and the Heart	465
• The Heart Has Four Chambers	465
• Heart Valves Ensure One-Way Flow in the Heart	468
• Cardiac Muscle Cells Contract Without Nervous Stimulation	470
• Cardiac EC Coupling Combines Features of Skeletal and Smooth Muscle	471
• Cardiac Muscle Contraction Can Be Graded	472
• When Cardiac Muscle Is Stretched, It Contracts More Forcefully	472
• Action Potentials in Myocardial Cells Vary According to Cell Type	472
• Autonomic Neurotransmitters Modulate Heart Rate	475
• The Heart as a Pump	477
• Electrical Conduction in the Heart Coordinates Contraction	477
• Pacemakers Set the Heart Rate	479
 <i>Clinical Focus: Fibrillation</i>	479
• The Electrocardiogram Reflects the Electrical Activity of the Heart	480
• The Heart Contracts and Relaxes Once During a Cardiac Cycle	484
• Pressure-Volume Curves Represent One Cardiac Cycle	486
 <i>Clinical Focus: Gallops, Clicks, and Murmurs</i>	486
• Stroke Volume Is the Volume of Blood Pumped by One Ventricle in One Contraction	487
• Cardiac Output Is a Measure of Cardiac Performance	489
• Heart Rate Is Modulated by Autonomic Neurons and Catecholamines	489
• Multiple Factors Influence Stroke Volume	490
• Contractility Is Controlled by the Nervous and Endocrine Systems	491

• EDV and Arterial Blood Pressure Determine Afterload	493
 <i>Emerging Concepts: Stem Cells for Heart Disease</i>	493
Chapter Summary	495
Questions	497
Answers	498

15 Blood Flow and the Control of Blood Pressure

 <i>Running Problem: Essential Hypertension</i>	501
• The Blood Vessels	502
• Blood Vessels Contain Vascular Smooth Muscle	502
• Arteries and Arterioles Carry Blood Away from the Heart	502
• Exchange Between the Blood and Interstitial Fluid Takes Place in the Capillaries	503
• Blood Flow Converges in the Venules and Veins	503
• Angiogenesis Creates New Blood Vessels	503
• Blood Pressure	504
• Systemic Blood Pressure Is Highest in Arteries and Lowest in Veins	505
• Arterial Blood Pressure Reflects the Driving Pressure for Blood Flow	506
• Blood Pressure Is Estimated by Sphygmomanometry	506
• Cardiac Output and Peripheral Resistance Determine Mean Arterial Pressure	507
• Changes in Blood Volume Affect Blood Pressure	508
• Resistance in the Arterioles	509
• Myogenic Autoregulation Automatically Adjusts Blood Flow	510
 <i>Clinical Focus: Shock</i>	510
• Paracrines Alter Vascular Smooth Muscle Contraction	511
• The Sympathetic Branch Controls Most Vascular Smooth Muscle	512
 <i>Emerging Concepts: From Dynamite to Vasodilation</i>	513
• Distribution of Blood to the Tissues	514
• Exchange at the Capillaries	514
• Velocity of Blood Flow Is Lowest in the Capillaries	516
• Most Capillary Exchange Takes Place by Diffusion and Transcytosis	517
• Capillary Filtration and Absorption Take Place by Bulk Flow	517

• The Lymphatic System	519
• Edema Is the Result of Alterations in Capillary Exchange	520
• Regulation of Blood Pressure	521
• The Baroreceptor Reflex Is the Primary Homeostatic Control for Blood Pressure	521
• Orthostatic Hypotension Triggers the Baroreceptor Reflex	523
• Cardiovascular Disease	525
• Risk Factors for Cardiovascular Disease Include Smoking, Obesity, and Inheritable Factors	525
• Atherosclerosis Is an Inflammatory Process	525
 <i>Clinical Focus: Diabetes and Cardiovascular Disease</i>	526
 <i>Emerging Concepts: Inflammatory Markers for Cardiovascular Disease</i>	526
• Hypertension Represents a Failure of Homeostasis	528
Chapter Summary	529
Questions	531
Answers	533

16 Blood

 <i>Running Problem: Blood Doping in Athletes</i>	536
• Plasma and the Cellular Elements of Blood	536
• Plasma Is Composed of Water, Ions, Organic Molecules, and Dissolved Gases	536
• The Cellular Elements Include Red Blood Cells, White Blood Cells, and Platelets	538
• Blood Cell Production	538
• Blood Cells Are Produced in the Bone Marrow	539
• Hematopoiesis Is Controlled by Colony-Stimulating Factors, Interleukins, and Other Cytokines	540
• Colony-Stimulating Factors Regulate Leukopoiesis	540
• Thrombopoietin Regulates Platelet Production	541
• Erythropoietin Regulates Red Blood Cell Production	541
• Red Blood Cells	542
• Mature Red Blood Cells Lack a Nucleus	542
• Hemoglobin Synthesis Requires Iron	543
• Red Blood Cells Live About Four Months	544
 <i>Clinical Focus: Hemoglobin and Hyperglycemia</i>	545
• Red Blood Cell Disorders Decrease Oxygen Transport	546

• Platelets and Coagulation	547
• Platelets Are Small Fragments of Cells	547
• Hemostasis Prevents Blood Loss from Damaged Vessels	548
• Platelet Activation Begins the Clotting Process	549
• Coagulation Converts the Platelet Plug into a More Stable Clot	551
• Anticoagulants Prevent Coagulation	551
 <i>Emerging Concepts: Clot Busters and Antiplatelet Agents</i>	554
Chapter Summary	555
Questions	556
Answers	557

17 Mechanics of Breathing

 <i>Running Problem: Emphysema</i>	559
• The Respiratory System	559
• Bones and Muscles of the Thorax Surround the Lungs	560
• Pleural Sacs Enclose the Lungs	560
• Airways Connect Lungs to the External Environment	561
• Alveoli Are the Site of Gas Exchange	561
• The Pulmonary Circulation Is a High-Flow, Low-Pressure System	561
 <i>Clinical Focus: Congestive Heart Failure</i>	565
• Gas Laws	565
• Air Is a Mixture of Gases	565
• Gases Move from Areas of Higher Pressure to Areas of Lower Pressure	566
• Boyle's Law Describes Pressure-Volume Relationships of Gases	566
• Ventilation	567
• Lung Volumes Change During Ventilation	567
• The Airways Warm, Humidify, and Filter Inspired Air	568
• During Ventilation, Air Flows Because of Pressure Gradients	569
• Inspiration Occurs When Alveolar Pressure Decreases	570
• Expiration Occurs When Alveolar Pressure Exceeds Atmospheric Pressure	572
• Intrapleural Pressure Changes During Ventilation	572
• Lung Compliance and Elastance May Change in Disease States	574
 <i>Clinical Focus: Fibrotic Lung Disease</i>	574
• Surfactant Decreases the Work of Breathing	575

• Airway Diameter Is the Primary Determinant of Airway Resistance	576
• Rate and Depth of Breathing Determine the Efficiency of Breathing	577
• Gas Composition in the Alveoli Varies Little During Normal Breathing	578
• Ventilation and Alveolar Blood Flow Are Matched	579
• Auscultation and Spirometry Assess Pulmonary Function	580
Chapter Summary	583
Questions	584
Answers	586

18 Gas Exchange and Transport

 <i>Running Problem: High Altitude</i>	588
• Diffusion and Solubility of Gases	588
• The Solubility of Gases in Liquids Depends on Pressure, Solubility, and Temperature	589
• Gas Exchange in the Lungs and Tissues	589
• A Decrease in Alveolar P_{O_2} Decreases Oxygen Uptake at the Lungs	591
• Changes in the Alveolar Membrane Alter Gas Exchange	592
 <i>Biotechnology: The Pulse Oximeter</i>	593
• Gas Transport in the Blood	593
• Hemoglobin Transports Most Oxygen to the Tissues	593
 <i>Emerging Concepts: Blood Substitutes</i>	594
• One Hemoglobin Molecule Binds Up to Four Oxygen Molecules	595
• Oxygen-Hemoglobin Binding Obeys the Law of Mass Action	595
• P_{O_2} Determines Oxygen-Hemoglobin Binding	596
• Oxygen Binding Is Expressed as a Percentage	596
• Temperature, pH, and Metabolites Affect Oxygen-Hemoglobin Binding	598
• Carbon Dioxide Is Transported in Three Ways	599
• Regulation of Ventilation	602
• Neurons in the Medulla Control Breathing	602
• Carbon Dioxide, Oxygen, and pH Influence Ventilation	604
• Protective Reflexes Guard the Lungs	607
• Higher Brain Centers Affect Patterns of Ventilation	607
Chapter Summary	609
Questions	609
Answers	611

19 The Kidneys	613
 <i>Running Problem: Gout</i>	614
• Functions of the Kidneys	614
• Anatomy of the Urinary System	615
• The Urinary System Consists of Kidneys, Ureters, Bladder, and Urethra	615
 <i>Clinical Focus: Urinary Tract Infections</i>	615
• The Nephron Is the Functional Unit of the Kidney	615
• Overview of Kidney Function	618
• The Three Processes of the Nephron Are Filtration, Reabsorption, and Secretion	618
• Volume and Osmolarity Change as Fluid Flows Through the Nephron	619
• Filtration	620
• The Renal Corpuscle Contains Three Filtration Barriers	620
• Filtration Occurs Because of Hydrostatic Pressure in the Capillaries	621
• Blood Pressure and Renal Blood Flow Influence GFR	622
 <i>Emerging Concepts: Diabetic Nephropathy</i>	623
• GFR Is Subject to Autoregulation	624
• Hormones and Autonomic Neurons Also Influence GFR	625
• Reabsorption	626
• Reabsorption May Be Active or Passive	626
• Saturation of Renal Transport Plays an Important Role in Kidney Function	628
 <i>Biotechnology: Artificial Kidneys</i>	628
• Peritubular Capillary Pressures Favor Reabsorption	629
• Secretion	630
• Competition Decreases Penicillin Secretion	631
• Excretion	631
• Clearance Is a Noninvasive Way to Measure GFR	632
• Clearance and GFR Help Us Determine Renal Handling of Solutes	633
• Micturition	635
Chapter Summary	637
Questions	638
Answers	639

20 Integrative Physiology II: Fluid and Electrolyte Balance	641
 <i>Running Problem: Hyponatremia</i>	642
• Fluid and Electrolyte Homeostasis	642
• ECF Osmolarity Affects Cell Volume	642

 <i>Emerging Concepts: Regulation of Cell Volume</i>	642
• Fluid and Electrolyte Balance Requires Integration of Multiple Systems	643
• Water Balance	643
• Daily Water Intake and Excretion Are Balanced	644
• The Kidneys Conserve Water	644
• Urine Concentration Is Determined in the Loop of Henle and Collecting Duct	645
 <i>Clinical Focus: Osmotic Diuresis</i>	646
• Vasopressin Controls Water Reabsorption	646
• Changes in Blood Pressure, Volume, and Osmolarity Trigger Water Balance Reflexes	648
 <i>Clinical Focus: Bed-Wetting and Vasopressin</i>	648
• The Loop of Henle Is a Countercurrent Multiplier	649
• Sodium Balance and ECF Volume	652
• Aldosterone Controls Sodium Balance	652
• Blood Pressure Is the Primary Stimulus for Aldosterone Secretion	653
• Angiotensin II Influences Blood Pressure Through Multiple Pathways	654
• Atrial Natriuretic Peptide Promotes Na ⁺ and Water Excretion	656
• Potassium Balance	656
• Behavioral Mechanisms in Salt and Water Balance	658
• Drinking Replaces Fluid Loss	658
• Low Na ⁺ Stimulates Salt Appetite	658
• Avoidance Behaviors Help Prevent Dehydration	658
• Integrated Control of Volume and Osmolarity	659
• Osmolarity and Volume Can Change Independently	659
• Dehydration Triggers Renal and Cardiovascular Responses	661
• Acid-Base Balance	663
• Enzymes and the Nervous System Are Particularly Sensitive to Changes in pH	663
• Acids and Bases in the Body Come from Many Sources	664
• pH Homeostasis Depends on Buffers, the Lungs, and the Kidneys	664
• Buffer Systems Include Proteins, Phosphate Ions, and HCO ₃ ⁻	665
• Ventilation Can Compensate for pH Disturbances	666

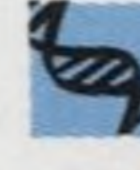

• Kidneys Use Ammonia and Phosphate Buffers	667
• The Proximal Tubule Secretes H^+ and Reabsorbs HCO_3^-	667
• The Distal Nephron Controls Acid Excretion	668
• Acid-Base Disturbances May Be Respiratory or Metabolic in Origin	669
Summary	672
Questions	674
Answers	675

UNIT 4

METABOLISM, GROWTH, AND AGING

21 The Digestive System	676
 <i>Running Problem: Peptic Ulcers</i>	677
• Function and Processes of the Digestive System	677
• Anatomy of the Digestive System	678
• The Digestive System Consists of Oral Cavity, GI Tract, and Accessory Glandular Organs	679
• The GI Tract Wall Has Four Layers	679
• Motility	682
• GI Smooth Muscle Contracts Spontaneously	682
 <i>Emerging Concepts: Interstitial Cells of Cajal</i>	683
• GI Smooth Muscle Exhibits Different Patterns of Contraction	683
• Secretion	684
• The Digestive System Secretes Ions and Water	685
• Digestive Enzymes Are Secreted into the Mouth, Stomach, and Intestine	687
• Specialized Cells Secrete Mucus	687
• Saliva Is an Exocrine Secretion	689
• The Liver Secretes Bile	689
• Regulation of GI Function	689
• The Enteric Nervous System Can Act Independently of the CNS	690
• GI Peptides Include Hormones, Neuropeptides, and Cytokines	691
• Digestion and Absorption	693
• Carbohydrates Are Absorbed as Monosaccharides	693
• Proteins Are Digested into Small Peptides and Amino Acids	694
• Some Larger Peptides Can Be Absorbed Intact	695
• Bile Salts Facilitate Fat Digestion	696
• Nucleic Acids Are Digested into Nitrogenous Bases and Monosaccharides	697

• The Intestine Absorbs Vitamins and Minerals	698
 <i>Biotechnology: Olestra, the No-calorie Fat Substitute</i>	698
• The Intestines Absorb Ions and Water	698
• The Cephalic Phase	699
• Chemical and Mechanical Digestion Begins in the Mouth	699
• Swallowing Moves Food from the Mouth to the Stomach	699
• The Gastric Phase	700
• The Stomach Stores Food	702
• The Stomach Secretes Acid, Enzymes, and Signal Molecules	702
 <i>Clinical Focus: Delayed Gastric Emptying</i>	702
• The Stomach Balances Digestion and Protection	703
• The Intestinal Phase	704
• Bicarbonate in the Small Intestine Neutralizes Gastric Acid	705
• Most Fluid Is Absorbed in the Small Intestine	706
• Most Digestion Occurs in the Small Intestine	706
 <i>Clinical Focus: Lactose Intolerance</i>	707
• The Large Intestine Concentrates Waste for Excretion	707
• Diarrhea Can Cause Dehydration	709
• Immune Functions of the GI Tract	709
• M Cells Sample the Contents of the Gut	709
• Vomiting Is a Protective Reflex	710
Chapter Summary	711
Questions	713
Answers	714

22 Metabolism and Energy Balance	716
 <i>Running Problem: Eating Disorders</i>	717
• The Brain Controls Food Intake	717
• Energy Balance	718
• Energy Input Equals Energy Output	718
 <i>Biotechnology: Novel Approaches for Discovering Peptides</i>	719
• Energy Use Is Reflected by an Individual's Oxygen Consumption	719
• Energy Is Stored in Fat and Glycogen	721
• Metabolism	721
• Energy from Ingested Nutrients May Be Used Immediately or Stored	722
• Hormones Control Metabolic Pathways by Changing Enzyme Activity	723
• Anabolic Metabolism Dominates in the Fed State	723

• Plasma Cholesterol Levels Are Predictors of Coronary Heart Disease	725
• Catabolic Metabolism Dominates in the Fasted State	727
• Homeostatic Control of Metabolism	728
• The Pancreas Secretes Insulin and Glucagon	728
• The Insulin-to-Glucagon Ratio Regulates Metabolism	729
•  <i>Clinical Focus: Ketogenic Diets</i>	729
• Insulin Is the Dominant Hormone of the Fed State	729
• Insulin Promotes Anabolism	731
• Glucagon Is Dominant in the Fasted State	734
• Diabetes Mellitus Is a Family of Metabolic Disorders	734
• Type 1 Diabetics Are Prone to Ketoacidosis	735
• Type 2 Diabetics Often Have Elevated Insulin Levels	736
• Metabolic Syndrome Links Diabetes and Cardiovascular Disease	739
• Regulation of Body Temperature	739
• Body Temperature Is a Balance Between Heat Production, Gain, and Loss	740
• Body Temperature Is Homeostatically Regulated	741
• The Body Produces Heat Through Movement and Metabolism	743
• The Body's Thermostat Can Be Reset	743
Chapter Summary	746
Questions	747
Answers	748

23 Endocrine Control of Growth and Metabolism

•  <i>Running Problem: Hyperparathyroidism</i>	751
• Review of Endocrine Principles	751
• Adrenal Glucocorticoids	751
• The Adrenal Cortex Secretes Steroid Hormones	751
• Cortisol Secretion Is Controlled by ACTH	753
• Cortisol Is Essential for Life	754
• Cortisol Is a Useful Therapeutic Drug	755
• Cortisol Pathologies Result from Too Much or Too Little Hormone	755
• CRH and ACTH Have Additional Physiological Functions	756
• Thyroid Hormones	756
• Thyroid Hormones Contain Iodine	757
•  <i>Emerging Concepts: Melanocortins and the Agouti Mouse</i>	757

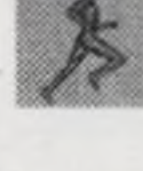

• Thyroid Hormones Affect Quality of Life	759
• TSH Controls the Thyroid Gland	761
• Growth Hormone	761
• Growth Hormone Is Anabolic	762
• Growth Hormone Is Essential for Normal Growth in Children	764
• Genetically Engineered Human Growth Hormone Raises Ethical Questions	764
• Tissue and Bone Growth	764
• Tissue Growth Requires Hormones and Paracrines	765
• Bone Growth Requires Adequate Dietary Calcium	765
• Calcium Balance	766
• Calcium Concentrations in the Blood Are Closely Regulated	767
• Three Hormones Control Calcium Balance	768
• Calcium and Phosphate Homeostasis Are Linked	770
• Osteoporosis Is a Disease of Bone Loss	771
Chapter Summary	772
Questions	773
Answers	774

24 The Immune System

•  <i>Running Problem: Treatment for AIDS</i>	777
• Overview of Immune System Function	777
• Pathogens of the Human Body	778
• Bacteria and Viruses Require Different Defense Mechanisms	778
• Viruses Can Replicate Only Inside Host Cells	778
•  <i>Emerging Concepts: Retroviruses</i>	779
• The Immune Response	779
• Anatomy of the Immune System	780
•  <i>Focus on ... the Spleen</i>	781
• Lymphoid Tissues Are Distributed Throughout the Body	781
• Leukocytes Are the Primary Cells of the Immune System	782
• Innate Immunity: Nonspecific Responses	784
• Physical and Chemical Barriers Are the Body's First Line of Defense	784
• Phagocytes Recognize and Ingest Foreign Material	784
• Natural Killer Lymphocytes Eliminate Virally Infected and Tumor Cells	785
• Chemical Mediators Create the Inflammatory Response	786
• Acquired Immunity: Antigen-Specific Responses	787

• Lymphocytes Are the Primary Cells Involved in the Acquired Immune Response	788
• B Lymphocytes Differentiate into Plasma Cells and Memory Cells	788
• Antibodies Are Proteins Secreted by Plasma Cells	789
• T Lymphocytes Must Make Direct Contact with Their Target Cells	791
 <i>Focus on ... the Thymus</i>	792
• Immune Response Pathways	794
• Inflammation Is the Typical Response to Bacterial Invasion	794
• Intracellular Defense Mechanisms Are Needed to Fight Viral Infections	795
• Allergic Responses Are Inflammatory Responses Triggered by Specific Antigens	797
• MHC Proteins Allow Recognition of Foreign Tissue	798
• Recognition of Self Is an Important Function of the Immune System	799
 <i>Biotechnology: Engineered Antibodies</i>	800
• Immune Surveillance Allows the Body to Remove Abnormal Cells	800
• Neuro-Endocrine-Immune Interactions	800
• Stress Alters Immune System Function	802
• Modern Medicine Incorporates Mind-Body Therapeutics	802
Chapter Summary	803
Questions	805
Answers	806

25 Integrative Physiology III: Exercise

 <i>Running Problem: Heat Stroke</i>	808
• Metabolism and Exercise	808
• Hormones Regulate Metabolism During Exercise	810
• Oxygen Consumption Is Related to Exercise Intensity	810
• Several Factors Limit Exercise	811
• Ventilatory Responses to Exercise	811
• Cardiovascular Responses to Exercise	812
• Cardiac Output Increases During Exercise	812
• Peripheral Blood Flow Redistributes to Muscle During Exercise	813
• Blood Pressure Rises Slightly During Exercise	813
• The Baroreceptor Reflex Adjusts to Exercise	814
• Feedforward Responses to Exercise	815
• Temperature Regulation During Exercise	815
• Exercise and Health	815

• Exercise Lowers the Risk of Cardiovascular Disease	816
• Type 2 Diabetes Mellitus May Improve with Exercise	816
• Stress and the Immune System May Be Influenced by Exercise	817
Chapter Summary	818
Questions	819
Answers	820

26 Reproduction and Development

 <i>Running Problem: Infertility</i>	822
• Sex Determination	822
• The Sex Chromosomes Determine Genetic Sex	823
 <i>Clinical Focus: X-Linked Inherited Disorders</i>	823
• Sexual Differentiation Occurs in the Second Month of Development	825
• Basic Patterns of Reproduction	826
 <i>Clinical Focus: Determining Gender</i>	827
• Gametogenesis Begins <i>in Utero</i> and Resumes During Puberty	827
• The Brain Directs Reproduction	829
• Reproduction Is Influenced by Environmental Factors	831
• Male Reproduction	831
• The Testes Produce Sperm and Testosterone	833
• Spermatogenesis Requires Gonadotropins and Testosterone	835
• Male Accessory Glands Contribute Secretions to Semen	836
• Androgens Influence Secondary Sex Characteristics	836
• Female Reproduction	836
• The Female Reproductive Tract Includes Ovaries and Uterus	836
• The Ovary Produces Eggs and Hormones	837
• A Menstrual Cycle Lasts About One Month	837
• Hormonal Control of the Menstrual Cycle Is Complex	841
• Estrogens and Androgens Influence Female Secondary Sex Characteristics	843
• Procreation	844
• The Human Sexual Response Has Four Phases	844
• The Male Sex Act Includes Erection and Ejaculation	844
• Sexual Dysfunction Affects Males and Females	845

• Contraceptives Are Designed to Prevent Pregnancy	846
• Infertility Is the Inability to Conceive	847
• Pregnancy and Parturition	848
• Fertilization Requires Capacitation	848
• The Developing Embryo Implants in the Endometrium	849
• The Placenta Secretes Hormones During Pregnancy	849
• Pregnancy Ends with Labor and Delivery	851
• The Mammary Glands Secrete Milk During Lactation	852
• Prolactin Has Other Physiological Roles	854
• Growth and Aging	854
• Puberty Marks the Beginning of the Reproductive Years	854
• Menopause and Andropause are a Consequence of Aging	855
