1. Introduction			
Part I			
Reviews			
2. Public service contracts in the bus sector			
2.1 Introduction and background	5		
2.2 Contract theory and risk	6		
2.3 Efficient contracting	7		
2.3.1 The output that the principal cares about can be easily described	7		
2.3.2 The agent has considerable discretion in their actions	7		
2.3.3 The agent owns assets	8		
2.4 Why are performance-based contracts so rare?	8		
2.5 An overview of contract regimes in passenger transport	8		
2.5.1 Competitive tendering	8		
2.5.2 Negotiated performance-based contracts	9		
2.6 Establishing a setting in which to compare the performance of operators	11		
2.7 Conclusions	13		
3. Disruptive technology and moving people			
3.1 Scope	15		
3.2 Disruptive technological changes affecting land passenger transport	16		
3.2.1 Scope	16		
3.2.2 Smartphone based apps, shared mobility and MaaS	17		
3.2.3 Autonomous vehicles	18		
3.2.4 Electric vehicles	20		
3.2.5 Conclusion	20		
		3.3 Assessing improvements in societal wellbeing	21
		3.3.1 Common goals for cities and regions	21
		3.3.2 Performance indicators	21
		3.4 Some societal trends relevant to technological disruption in land passenger transport	23
		3.4.1 Context	23
		3.4.2 Ageing population	23
		3.4.3 Have your own or be part of a sharing economy?	24
		3.4.4 Rise of the knowledge economy	25
		3.4.5 Land use transport integration	26
		3.4.6 Increasing inequality	27
		3.4.7 Reducing greenhouse gas emissions	28
		3.4.8 Conclusion	28
		3.5 Scenarios	29
		3.5.1 Two future scenarios and their potential effects	29
		3.5.2 An optimistic scenario	29
		3.5.3 A pessimistic scenario	31
		3.5.4 Implications for public transport	32
		3.6 Policy implications	37
		3.6.1 Context	37
		3.6.2 Improved governance arrangements	38
		3.6.3 Containing urban sprawl	39
		3.6.4 Transport pricing reform	40
		3.6.5 Mandatory emissions standards	41
		Appendix 3A	41

Part II Contracting

6. Contracting regimes for bus services: what have we learnt in recent years?

6.1	Background	69
6.2	Contract regimes: the case for negotiation	69
6.3	Contract completeness: why trust is fundamental	71
6.4	Building trust through partnership	72
6.5	Tactical level planning: the foundation for unleashing value for money	73
6.6	Conclusions	73

7. Incompleteness and clarity in bus contracts

7.1	Introduction	75
7.2	A framework in which to identify contract incompleteness and clarity	75
7.3	Empirical application	78
7.4	Empirical analysis	79
7.5	Conclusions	90

8. A simplified performance-linked value for money model for bus contract payments

8.1	Background	91
8.2	A proposed simplified performance-linked payment (SPLP) model	93

8.3	Establishing benchmark value for money outcomes	94
8.4	Using the benchmark value for money outcomes	98
8.5	Conclusions	98

9. Bus contract costs, user perceived service quality and performance assessment

9.1	Introduction	101
9.2	Developing a service quality index	102
9.3	Results of the user preference model	104
9.4	The service quality index (SQI)	107
9.5	Linking service quality to cost and demand	110
9.6	The relationship between average cost per km and SQI	111
9.7	Determination of service performance standards and operator compliance	112
9.8	Conclusions	116

10. Customer service quality and benchmarking in bus contracts

10.1	Introduction	119
10.2	Concerns about traditional likert scale metrics of customer satisfaction	119
10.3	Developing a customer service quality index	120
10.4	The user preference model results	124
10.5	The customer service quality index (CSQI) and benchmarking	128
10.6	Conclusions	131
	Appendix	132
	Notation	132

11. Are there cost efficiency gains through competitive tendering or negotiated performance-based contracts and benchmarking in the absence of an incumbent public monopolist?

11.1	Introduction	133
11.2	A brief overview of negotiated performance-based contracts and competitive tendering	136
11.3	Approach to establishing benchmarked cost efficiency	137
11.4	A comparative assessment of NPBC and CT in Australia	138
11.5	Conclusions	142

12. Efficient contracting and incentive agreements: the influence of risk preferences of contracting agents on contract choice

12.1	Introduction	143
12.2	Contract theory	144
12.3	Efficient contracting	145
12.3.1	The output that the principal cares about can be easily described	145
12.3.2	The agent has considerable discretion in their actions	146
12.3.3	The agent owns assets	146
12.3.4	Why are performance-based contracts so rare?	146
12.4	Using choice experiments as a way of empirically investigating contract preferences	147
12.5	Designing the choice experiments for contract assessment	148
12.5.1	The choice experiment	148
12.5.2	The experiment and the sample	150
12.5.3	Model estimation form	151
12.5.4	Model results	155
12.5.5	A simple application formula	157
12.6	Conclusions	159
	Appendix A. The experimental design of PT contract preferences	160

13. Using contracted assets to undertake non-contracted services to improve cost efficiency

13.1	Introduction and background	163
13.2	A case study	164
13.3	Conclusions	167

14. Disruption costs in bus contract transitions

14.1	Introduction	169
14.2	Accounting for reputational risk in the assessment of contracting offers	170
14.3	The mixed logit model	171
14.4	Development of the sample and the survey instrument	172
14.5	Descriptive profile of sample	174
14.6	Key findings	175
14.7	Conclusions and implications	177
	Appendix 14.A: Background questions	178

Part III

Bus rapid transit

15. Sustainable bus systems: moving towards a value for money and network-based approach and away from blind commitment

15.1	Introduction	183
15.2	The appeal of BRT	185
15.3	Conclusions	187
	Appendix	187

16. Ridership drivers of bus based transit systems

16.1	Introduction	191
16.2	Data	191
16.3	Methodology	195
16.4	Sources of systematic variation in BRT ridership	195
16.5	Conclusions	198
	Appendix 16.A: descriptive statistics and correlation matrix for variables in Table 16.2	198
	Appendix 16.B: random effects ridership regression model with GDP per capita and population density	200

17. Performance contributors of bus rapid transit systems within the ITDP BRT standard

17.1	Introduction	201
17.2	The ITDP approach	202
17.3	The ordered choice model	204
17.4	Data	204
17.5	Revealed predictors of the BRT standard	205
17.6	Applications: business-as-usual projection and what-if analysis	207
17.7	Conclusions	208

18. Review of bus rapid transit and branded bus service performance in Australia

18.1	The BRT debate: what happened?	209
18.2	An overview of BRT and BBS in Australia	210
18.3	Gross performance comparison	211

18.4 Rationale for normalisation	214	21.2 The data source	258
18.5 Net performance comparison	215	21.3 The evidence	258
18.6 Discussions and conclusions	217	21.4 Conclusions	261
Appendix: included routes in each service cluster	219	Appendix 21.A profile of data by elasticity type	263
Acknowledgements	219	Appendix 21.B Key data sources	265

Part IV Image

19. Identifying resident preferences for bus and rail investments	
19.1 Introduction	223
19.2 Drivers of community preferences for public transport	223
19.3 Overview of the random regret mixed logit model	224
19.4 Empirical study	226
19.5 Model results	227
19.6 Application to project planning	228
19.6.1 Elasticities	231
19.6.2 The resident preference model	231
19.7 Conclusions and synthesis	233
20. Cultural contrasts of preferences for bus rapid transit and light rail transit	
20.1 Introduction	235
20.2 Literature review	235
20.3 The choice experiment	236
20.4 The samples and sources	237
20.5 Descriptive profile of sample	239
20.6 The mode preference model form	240
20.7 Model results	243
20.8 Willingness to pay	243
20.9 Community preference model: simulated scenarios	247
20.10 Conclusions	251
Appendix 20.A	252

Part V Elasticities

21. Assessing sources of variation in public transport elasticities: some warnings	
21.1 Introduction	257

Part VI Crowding

22. A review of willingness to pay evidence on public transport crowding	
22.1 Introduction	269
22.2 Valuation of in-vehicle crowding	271
22.2.1 Time multiplier	271
22.2.2 Monetary value (\$) per minute or hour	272
22.2.3 Monetary value (\$) per trip	273
22.3 Valuation of crowding in access-ways and platforms	275
22.4 Synthesis of WTP estimates	276
22.5 Conclusions and policy implications	276
23. A review of objective and subjective measures of crowding in public transport	
23.1 Introduction	281
23.2 Measures of crowding	282
23.2.1 Conventional bus and bus rapid transit (BRT)	282
23.2.2 Measures of crowding: passenger train	282
23.3 Monitored crowding vs. experienced crowding: evidence from Melbourne and Sydney	285
23.4 Subjective or psychological components of crowding	288
23.5 Linking subjective and objective measures to measurable users benefits for inclusion in benefit-cost analysis	291
23.6 Conclusions and recommendations	292
Appendix 23.A: Measuring subjective evaluations of crowding or perceived crowdedness (Mohd Mahudin et al., 2012)	293

24. The effects of passenger crowding on public transport demand and supply

24.1	Introduction	295
24.2	Effects of passenger density and crowding	296
24.2.1	Effect on in-vehicle time	296
24.2.2	Effect on waiting time	297
24.2.3	Effect on travel time reliability	297
24.2.4	Effect on wellbeing	297
24.2.5	Effect on the valuation of travel time savings	298
24.2.6	Effect on route and bus choice	299
24.2.7	Effect on optimal public transport supply and fare	300
24.3	Estimation of crowding and standing costs	300
24.4	Effect of crowding disutility on demand estimation	305
24.5	Summary and conclusions	307

25. Multimodal transport pricing with extensions to non-motorised transport

25.1	Introduction	309
25.2	Setting public transport fares: first best and second best models	309
25.2.1	First best pricing	309
25.2.2	Second best pricing	310
25.2.3	Issues that arise when subsidising public transport	311
25.3	Results that matter	311
25.3.1	Optimal frequency and capacity	311
25.3.2	When the capacity constraint is binding	312
25.3.3	The effect of including other externalities beyond congestion	312
25.3.4	Dedicated bus lanes	313
25.3.5	Interactions with other sectors of the economy	313
25.3.6	Effects of bus congestion and congestion interactions	314
25.3.7	Non-motorised transport	314
25.4	A three-mode pricing model	315
25.4.1	Introduction	315
25.4.2	Model assumptions	315
25.4.3	First best pricing	316
25.4.4	Second best pricing	317
25.4.5	Extensions: other external costs and collection costs	318
25.5	Summary and conclusions	319
	Appendix	320

Part VII

Transport appraisal

323

26. Estimating the wider economic benefits of the Sydney North West Rail Link project

26.1	Introduction	325
26.2	Welfare benefits	325
26.2.1	Agglomeration economies	325
26.2.2	Increased output in imperfectly-competitive markets	329
26.2.3	Welfare benefits arising from improved labour supply	330
26.3	GDP impacts	331
26.3.1	More people choose to work due to changes in effective wages	331
26.3.2	Some people choose to work longer hours	332
26.3.3	Move to higher productive jobs	332
26.3.4	Summary of the main assumptions	333
26.4	Case study – North West Rail Link	333
26.4.1	Define the base case and project case	334
26.4.2	Input data	334
26.4.3	Estimating the WEB welfare benefits	340
26.4.4	Estimation of the GDP impacts	342
26.4.5	Wider economic benefits results	344
26.4.6	Sensitivity tests of some assumptions	344
26.5	Concluding remarks	346

27. Clarifying the complementary contributions of cost benefit analysis and economic impact analysis in public transport investment

27.1	Introduction	349
27.2	Requirements for decision support	349
27.3	Contrasting analysis methods	350
27.3.1	The time dimension	351
27.3.2	The spatial dimension	351
27.3.3	The impact element dimension	352
27.4	Matching analysis methods to the context of decisions	352
27.5	The bus rapid transit (BRT) case study and its evaluation process	353

33.2.2	Defining the broker: new business models	449		
33.2.3	Situating the broker: mode-agnostic mobility contracts	449		
33.3	Methodology	450		
33.4	Mobility contract design	451		
33.4.1	Mobility offering (revenue mix)	451		
33.4.2	Government support	452		
33.4.3	Return on investment	453		
33.4.4	Business branding	453		
33.4.5	Equity contribution	453		
33.5	The survey instrument	454		
33.5.1	Choice tasks and choice responses	454		
33.5.2	Contextual variables and survey structure	455		
33.5.3	Candidate respondents	455		
33.6	Preliminary results	456		
33.7	Conclusion and next steps	459		
	Appendix	460		
34.	What might road congestion look like in the future under a collaborative and connected mobility model?			
34.1	Introduction	461		
34.2	Smart shared mobility and potential implications for levels of congestion	462		
34.3	The need for a governance framework to ensure smart mobility delivers congestion reduction	465		
34.4	Data access and sharing – necessary to manage network congestion	466		
34.5	Road pricing reform	467		
34.6	Conclusions	468		
	References	471		
	Index	497
