PART I Introductory topics

CHAPTER 1	Medical imaging modalities	3
	Mathias Unberath and Andreas Maier	
1.1	Introduction	3
1.2	Image quality	4
1.2.1	Resolution and noise	4
1.2.2	Comparing image appearance	6
1.2.3	Task-based assessment	6
1.3	Modalities and contrast mechanisms	7
1.3.1	X-ray transmission imaging	7
1.3.2	Molecular imaging	9
1.3.3	Optical imaging	11
1.3.4	Large wavelengths and transversal waves	12
1.3.5	A historical perspective on medical imaging	14
1.3.6	Simulating image formation	16
1.4	Clinical scenarios	16
1.4.1	Stroke	17
1.4.2	Oncology	17
1.4.3	Osteonecrosis	17
1.5	Exercises	18
	References	19
CHAPTER 2	Mathematical preliminaries	21
	Carlos Alberola-López and Alejandro F. Frangi	
2.1	Introduction	21
2.2	Imaging: definitions, quality and similarity measures	22
2.3	Vector and matrix theory results	23
2.3.1	General concepts	23
2.3.2	Eigenanalysis	28
2.3.3	Singular value decomposition	31
2.3.4	Matrix exponential	33
2.4	Linear processing and transformed domains	35
2.4.1	Linear processing. Convolution	35

	2.4.2	Transformed domains	37
2.5		Calculus	44
	2.5.1	Derivatives, gradients, and Laplacians	44
	2.5.2	Calculus of variations	45
	2.5.3	Some specific cases	48
	2.5.4	Leibniz rule for interchanging integrals and derivatives	50
2.6		Notions on shapes	50
	2.6.1	Procrustes matching between two planar shapes	50
	2.6.2	Mean shape	52
	2.6.3	Procrustes analysis in higher dimensions	53
2.7		Exercises	53
		References	56
CHAPTER 3		Regression and classification	57
		Thomas Moreau and Demian Wassermann	
3.1		Introduction	57
		Nomenclature	58
	3.1.1	Regression as a minimization problem	59
	3.1.2	Regression from the statistical angle	61
3.2		Multidimensional linear regression	62
	3.2.1	Direction of prediction	63
	3.2.2	Risk minimization	64
	3.2.3	Measures of fitting and prediction quality	68
	3.2.4	Out-of-sample performance: cross-validation methods	70
	3.2.5	Shrinkage methods	73
3.3		Treating non-linear problems with linear models	77
	3.3.1	Generalized linear models: transforming y	77
	3.3.2	Feature spaces: transforming X	80
	3.3.3	Going further	83
3.4		Exercises	83
		References	83
CHAPTER 4		Estimation and inference	85
		Gonzalo Vegas Sánchez-Ferrero and Carlos Alberola-López	
4.1		Introduction: what is estimation?	85
4.2		Sampling distributions	86
	4.2.1	Cumulative distribution function	87
	4.2.2	The Kolmogorov–Smirnov test	88
	4.2.3	Histogram as probability density function estimate	89
	4.2.4	The chi-squared test	92
4.3		Estimation. Data-based methods	93

4.3.1	Definition of estimator and criteria for design and performance measurement	93
4.3.2	A benchmark for unbiased estimators: the Cramer–Rao lower bound	95
4.3.3	Maximum likelihood estimator	96
4.3.4	The expectation-maximization method	97
4.4	A working example	101
4.5	Estimation. Bayesian methods	103
4.5.1	Definition of Bayesian estimator and design criteria	103
4.5.2	Design criteria for Bayesian estimators	104
4.5.3	Performance measurement	105
4.5.4	The Gaussian case	106
4.5.5	Conjugate distribution and conjugate priors	107
4.5.6	A working example	107
4.6	Monte Carlo methods	108
4.6.1	A non-stochastic use of Monte Carlo	108
4.7	Exercises	109
	References	111

PART II Image representation and processing

CHAPTER 5	Image representation and 2D signal processing	115
	Santiago Aja-Fernández, Gabriel Ramos-Llordén, and Paul A. Yushkevich	
5.1	Image representation	115
5.2	Images as 2D signals	118
5.2.1	Linear space-invariant systems	119
5.2.2	Linear Circular Invariance systems	121
5.3	Frequency representation of 2D signals	122
5.3.1	Fourier transform of continuous signals	123
5.3.2	Discrete-space Fourier transform	124
5.3.3	2D discrete Fourier transform	125
5.3.4	Discrete cosine transform	125
5.4	Image sampling	127
5.4.1	Introduction	127
5.4.2	Basics on 2D sampling theory	127
5.4.3	Nyquist sampling density	134
5.5	Image interpolation	135
5.5.1	Typical interpolator kernels	137
5.6	Image quantization	140
5.7	Further reading	141
5.8	Exercises	141
	References	142

CHAPTER 6	Image filtering: enhancement and restoration	145
	Santiago Aja-Fernández, Ariel H. Curiale, and Jerry L. Prince	
6.1	Medical imaging filtering	145
6.2	Point-to-point operations	147
6.2.1	Basic operations	147
6.2.2	Contrast enhancement	148
6.2.3	Histogram processing	151
6.3	Spatial operations	156
6.3.1	Linear filtering	156
6.3.2	Non-linear filters	163
6.4	Operations in the transform domain	164
6.4.1	Linear filters in the frequency domain	165
6.4.2	Homomorphic processing	166
6.5	Model-based filtering: image restoration	166
6.5.1	Noise models	168
6.5.2	Point spread function	169
6.5.3	Image restoration methods	170
6.6	Further reading	173
6.7	Exercises	175
	References	175
CHAPTER 7	Multiscale and multiresolution analysis	177
	Jon Sporring	
7.1	Introduction	177
7.2	The image pyramid	177
7.3	The Gaussian scale-space	180
7.4	Properties of the Gaussian scale-space	182
7.4.1	The frequency perspective	182
7.4.2	The semi-group property	184
7.4.3	The analytical perspective	184
7.4.4	The heat diffusion perspective	185
7.5	Scale selection	185
7.5.1	Blob detection	186
7.5.2	Edge detection	187
7.6	The scale-space histogram	190
7.7	Exercises	194
	References	197
PART III Medical image segmentation		
CHAPTER 8	Statistical shape models	201
	Tim Cootes	
8.1	Introduction	201

8.2	Representing structures with points	202
8.3	Comparing shapes	203
8.4	Aligning two shapes	204
8.5	Aligning a set of shapes	204
8.5.1	Algorithm for aligning sets of shapes	205
8.5.2	Example of aligning shapes	205
8.6	Building shape models	205
8.6.1	Choosing the number of modes	207
8.6.2	Examples of shape models	207
8.6.3	Matching a model to known points	208
8.7	Statistical models of texture	209
8.8	Combined models of appearance (shape and texture)	212
8.9	Image search	212
8.10	Exhaustive search	214
8.10.1	Regression voting	215
8.11	Alternating approaches	216
8.11.1	Searching for each point	217
8.11.2	Shape model as regularizer	218
8.12	Constrained local models	219
8.12.1	Iteratively updating parameters	221
8.12.2	Extracting features	221
8.12.3	Updating parameters	222
8.13	3D models	223
8.14	Recapitulation	223
8.15	Exercises	224
	References	224
CHAPTER 9	Segmentation by deformable models	227
	Jerry L. Prince	
9.1	Introduction	227
9.2	Boundary evolution	228
9.2.1	Marker evolution	228
9.2.2	Level set evolution	229
9.3	Forces and speed functions	231
9.3.1	Parametric model forces	231
9.3.2	Geometric model speed functions	234
9.3.3	Non-conservative external forces	237
9.4	Numerical implementation	239
9.4.1	Parametric model implementation	239
9.4.2	Geometric model implementation	240
9.5	Other considerations	243
9.6	Recapitulation	245
9.7	Exercises	245
	References	246

CHAPTER 10	Graph cut-based segmentation	247
	Jens Petersen, Ipek Oguz, and Marleen de Bruijne	
10.1	Introduction	247
10.2	Graph theory	248
10.2.1	What is a graph?	248
10.2.2	Flow networks, max flow, and min cut	248
10.3	Modeling image segmentation using Markov random fields	248
10.4	Energy function, image term, and regularization term	251
10.4.1	Image term	251
10.4.2	Regularization term	251
10.5	Graph optimization and necessary conditions	252
10.5.1	Energy minimization and minimum cuts	252
10.5.2	Necessary conditions	252
10.5.3	Minimum cut graph construction	252
10.5.4	Limitations (and solutions)	255
10.6	Interactive segmentation	256
10.6.1	Hard constraints and user interaction	258
10.6.2	Example: coronary arteries in CT angiography ...	259
10.7	More than two labels	260
10.7.1	Move-making algorithm(s)	261
10.7.2	Ordered labels and convex priors	262
10.7.3	Optimal surfaces	265
10.7.4	Example: airways in CT	267
10.8	Recapitulation	272
10.9	Exercises	272
	References	273

PART IV Medical image registration

CHAPTER 11	Points and surface registration	277
	Shan Cong and Li Shen	
11.1	Introduction	277
11.2	Points registration	279
11.2.1	Procrustes analysis for aligning corresponding point sets	279
11.2.2	Quaternion algorithm for registering two corresponding point sets	281
11.2.3	Iterative closest point algorithm for general points registration	282
11.2.4	Thin plate spline for non-rigid alignment of two corresponding point sets	284
11.3	Surface registration	285
11.3.1	Surface mesh representation	286
11.3.2	Surface parameterization	288

	11.3.3	Surface registration strategies	291
11.4		Summary	299
11.5		Exercises	300
		References	300
CHAPTER 12		Graph matching and registration	303
		Aristeidis Sotiras, Mattias Heinrich, Julia Schnabel, and Nikos Paragios	
12.1		Introduction	303
12.2		Graph-based image registration	305
	12.2.1	Graphical model construction	307
	12.2.2	Optimization	316
	12.2.3	Application to lung registration	321
	12.2.4	Conclusion	325
12.3		Exercises	326
		References	327
CHAPTER 13		Parametric volumetric registration	331
		Paul A. Yushkevich, Miaomiao Zhang, and Jon Sporring	
13.1		Introduction to volumetric registration	331
	13.1.1	Definition and applications	331
	13.1.2	VR as energy minimization	334
13.2		Mathematical concepts	338
	13.2.1	Transformation	338
	13.2.2	Transformation vs. displacement	338
	13.2.3	Function composition	339
	13.2.4	Computer implementation of transformations	340
	13.2.5	Jacobian matrix and determinant	340
13.3		Parametric volumetric registration	341
	13.3.1	Transformations	342
	13.3.2	Optimization	349
	13.3.3	Real-world approaches	350
13.4		Exercises	352
		References	353
CHAPTER 14		Non-parametric volumetric registration	355
		Paul A. Yushkevich and Miaomiao Zhang	
14.1		Introduction	355
14.2		Mathematical concepts	356
	14.2.1	Diffeomorphisms	356
14.3		Optical flow and related non-parametric methods	361
	14.3.1	Conventional optical flow approach	361
	14.3.2	Iterative optical flow	366
14.4		Large deformation diffeomorphic metric mapping	373
	14.4.1	LDDMM formulation	373

	14.4.2	Approaches to solving the LDDMM problem	376
	14.4.3	LDDMM and computational anatomy	380
14.5		Exercises	383
		References	383
CHAPTER 15	Image mosaicking	387	
	Sophia Bano and Danail Stoyanov		
15.1	Introduction	387	
15.2	Motion models	389	
	15.2.1	Image transformations	389
	15.2.2	Affine transformation	390
	15.2.3	Projective transformation or homography	391
	15.2.4	Cylindrical and spherical modeling	392
15.3	Matching	392	
	15.3.1	Feature-based methods	392
	15.3.2	Direct methods	394
	15.3.3	Deep learning-based methods	396
	15.3.4	Computing homography – image mosaicking	397
	15.3.5	Reprojection and blending	398
15.4	Clinical applications	399	
	15.4.1	Panoramic X-ray in radiography	399
	15.4.2	Whole slide mosaicking in histopathology	400
	15.4.3	Cystoscopy in urology	401
	15.4.4	Slit-lamp image stitching for ophthalmology	401
	15.4.5	Fetal interventions and fetoscopy	402
	15.4.6	General surgery view expansion	404
15.5	Recapitulation	404	
15.6	Exercises	406	
	References	408	

PART V Machine learning in medical image analysis

CHAPTER 16	Deep learning fundamentals	415	
	Nishant Ravikumar, Arezoo Zakeri, Yan Xia, and Alejandro F. Frangi		
16.1	Introduction	415	
16.2	Learning as optimization	417	
	16.2.1	Multilayer perceptron	418
	16.2.2	Activation functions	422
	16.2.3	Loss functions	426
	16.2.4	Weight optimization	433
	16.2.5	Normalization in deep learning	437
	16.2.6	Regularization in deep learning	439
16.3	Inductive bias, invariance, and equivariance	443	

16.4	Recapitulation	444
16.5	Further reading	446
16.6	Exercises	446
	References	447
CHAPTER 17	Deep learning for vision and representation learning	451
	Arezoo Zakeri, Yan Xia, Nishant Ravikumar, and Alejandro F. Frangi	
17.1	Introduction	451
17.2	Convolutional neural networks	452
	17.2.1 Convolution arithmetic	454
	17.2.2 Forward and backward passes	455
	17.2.3 Pooling operations	457
	17.2.4 Dilated convolutions	458
	17.2.5 Transposed convolutions	459
	17.2.6 Residual (skip) connections	460
17.3	Deep representation learning	462
	17.3.1 Autoencoder architecture	462
	17.3.2 Denoising autoencoders	463
	17.3.3 Variational autoencoders	463
	17.3.4 Multichannel variational autoencoders	465
	17.3.5 Contrastive learning	466
	17.3.6 Framework, loss functions, and interpretation	467
	17.3.7 Contrastive learning with negative samples	468
	17.3.8 Contrastive learning without negative samples ...	469
17.4	Recapitulation	470
17.5	Further reading	472
17.6	Exercises	472
	References	473
CHAPTER 18	Deep learning medical image segmentation	475
	Sean Mullan, Lichun Zhang, Honghai Zhang, and Milan Sonka	
18.1	Introduction	475
18.2	Convolution-based deep learning segmentation	476
18.3	Transformer-based deep learning segmentation	481
	18.3.1 Scaled dot-product attention	481
	18.3.2 Positional embedding	483
	18.3.3 Vision transformers	484
18.4	Hybrid deep learning segmentation	485
	18.4.1 Deep LOGISMOS	486
	18.4.2 Machine-learned cost function	486
	18.4.3 Just-enough interaction	487

18.5	Training efficiency	488
18.6	Explainability	490
	18.6.1 Image attribution	491
	18.6.2 Attention gates	492
18.7	Case study	492
18.8	Recapitulation	495
18.9	Further reading	496
18.10	Exercises	496
	References	497
CHAPTER 19	Machine learning in image registration	501
	Bob D. de Vos, Hessam Sokooti, Marius Staring, and Ivana Išgum	
19.1	Introduction	501
19.2	Image registration with deep learning	502
19.3	Deep neural network architecture	504
19.4	Supervised image registration	506
	19.4.1 Supervision via conventional image registration ..	507
	19.4.2 Supervision via synthetic transformations	507
19.5	Unsupervised image registration	509
	19.5.1 Image similarity as a loss	510
	19.5.2 Metric learning	511
	19.5.3 Regularization and image folding	511
	19.5.4 Auxiliary losses	511
19.6	Recapitulation	512
19.7	Exercises	513
	References	514

PART VI Advanced topics in medical image analysis

CHAPTER 20	Motion and deformation recovery and analysis ..	519
	James S. Duncan and Lawrence H. Staib	
20.1	Introduction	519
	20.1.1 Notation: displacement, deformation, and strain ..	520
20.2	The unmet clinical need	522
20.3	Image-centric flow fields: Eulerian analysis	522
	20.3.1 Motion analysis with non-rigid image registration .	522
	20.3.2 Optical flow	525
20.4	Object-centric, locally derived flow fields: Lagrangian analysis	527
	20.4.1 Feature-based tracking	527
	20.4.2 Displacement regularization	531
20.5	Multiframe analysis: Kalman filters, particle tracking	532

20.6	Advanced strategies: model-based analysis and data-driven deep learning	535
20.6.1	Model-based strategies: biomechanics and deformation analysis	535
20.6.2	Deep learning for displacement field regularization	538
20.6.3	Deep learning for integrated motion tracking and segmentation	540
20.7	Evaluation	543
20.8	Recapitulation	544
20.9	Exercises	544
	References	546
CHAPTER 21	Imaging Genetics	549
	Marco Lorenzi and Andre Altmann	
21.1	Introduction	549
21.1.1	Heritability	550
21.1.2	Genetic variation	551
21.2	Genome-wide association studies	554
21.2.1	Genotyping using microarray technology	554
21.2.2	Processing SNP data	554
21.2.3	Imputation	555
21.2.4	Univariate analysis	556
21.2.5	Multiple testing correction	558
21.2.6	Adjustments for quantitative traits	559
21.2.7	Statistical power	559
21.2.8	GWAS and imaging phenotypes	561
21.3	Multivariate approaches to imaging genetics	562
21.3.1	A sketch on classical multivariate approaches	562
21.3.2	Regularization in multivariate imaging-genetics ..	567
21.3.3	Stability and validation of multivariate models ...	570
21.4	Exercises	571
	References	573

PART VII Large-scale databases

CHAPTER 22	Detection and quantitative enumeration of objects from large images	579
	Cheng Lu, Simon Graham, Nasir Rajpoot, and Anant Madabhushi	
22.1	Introduction	579
22.2	Classical image analysis methods	581
22.2.1	Thresholding	581
22.2.2	Filtering-based methods	583

22.3	Learning from data	585
22.3.1	Classical machine learning methods	586
22.3.2	Deep learning methods	589
22.4	Detection and counting of mitotic cells using Bayesian modeling and classical image processing	595
22.4.1	Detection and segmentation of MC candidates	596
22.4.2	Bayesian modeling for posterior map generation	596
22.4.3	MC candidate detection	596
22.4.4	Intact MC candidate region segmentation	596
22.4.5	Classification of MC candidates	599
22.5	Detection and counting of nuclei using deep learning	600
22.5.1	Patch extraction and data generation	601
22.5.2	Convolutional neural network architecture	601
22.5.3	Neural network optimization	601
22.5.4	Post-processing and cell counting	603
22.6	Recapitulation	604
22.7	Exercises	605
	References	606
CHAPTER 23	Image retrieval in big image data	609
	Sailesh Conjeti, Stefanie Demirci, and Vincent Christlein	
23.1	Introduction	609
23.2	Global image descriptors for image retrieval	611
23.2.1	Encoding	611
23.2.2	Normalization	612
23.3	Deep learning-based image retrieval	613
23.4	Efficient indexing strategies	614
23.4.1	Vocabulary tree	614
23.4.2	Hashing	616
23.5	Exercises	620
	References	621
 PART VIII Evaluation in medical image analysis		
CHAPTER 24	Assessment of image computing methods	625
	Ipek Oguz, Melissa Martin, and Russell T. Shinohara	
24.1	The fundamental methodological concept	625
24.2	Introduction	625
24.3	Evaluation for classification tasks	626
24.3.1	Evaluation for binary classification tasks	626
24.3.2	Evaluation for continuous prediction tasks	629
24.4	Learning and validation	630
24.5	Evaluation for segmentation tasks	633

24.6	Evaluation of registration tasks	637
24.7	Intra-rater and inter-rater comparisons	638
24.8	Recapitulation	640
24.9	Exercises	640
	References	641
	Index	643
