

Contents

1	Ecological genomics and genome analysis	1
1.1	The genomics revolution invading ecology	1
1.2	Yeast, fly, worm, and weed	3
1.3	-Omics speak	9
1.4	Genome analysis	15
2	Comparing genomes	38
2.1	Properties of genomes	38
2.2	Prokaryotic genomes	52
2.3	Eukaryotic genomes	64
3	Structure and function in communities	96
3.1	The biodiversity and ecosystem functioning synthetic framework	96
3.2	Measurement of microbial biodiversity	98
3.3	Microbial genomics of biogeochemical cycles	113
3.4	Reconstruction of functions from environmental genomes	129
3.5	Genomic approaches to biodiversity and ecosystem function: an appraisal	146
4	Life-history patterns	148
4.1	The core of life-history theory	148
4.2	Longevity and aging	153
4.3	Gene-expression profiles in the life cycle	167
4.4	Phenotypic plasticity of life-history traits	182
4.5	Genomic approaches to life-history patterns: an appraisal	192
5	Stress responses	195
5.1	Stress and the ecological niche	195
5.2	The main defence mechanisms against cellular stress	198
5.3	Heat, cold, drought, salt, and hypoxia	217
5.4	Herbivory and microbial infection	226
5.5	Toxic substances	234
5.6	Genomic approaches to ecological stress: an appraisal	243
6	Variation and adaptation	245
6.1	The internal tangled bank	245
6.2	Genomic polymorphisms	247
6.3	Regulatory and structural change	267

6.4	Epigenetic variation and developmental change	287
6.5	Genomic approaches to variation and adaptation: an appraisal	300
7	Integrative ecological genomics	302
7.1	The need for integration: systems biology	302
7.2	Ecological control analysis	307
7.3	Outlook	311
