Abstract	5
Abstrakt	6
List of Figures	9
List of Tables	11
Abbreviations	11
1 Introduction	17
1.1 Research objectives	20
2 Materials and microstructure characterization	21
2.1 Raw materials	21
2.2 Pure cement paste	22
2.2.1 Hydration reaction of the cement minerals	22
2.2.2 Morphology of the main hydration products	24
2.2.3 Heat influence on cement paste	26
2.3 Cement paste blended with silica fume	27
2.4 Cement paste blended with fly ash	27
2.5 Cement paste blended with GBFS	27
2.6 Alkali-activated fly ash	28
3 Principles and applications of nanoindentation techniques	30
3.1 Standard point and grid nanoindentation	30
3.2 Accelerated mechanical property mapping	32
3.3 Modulus mapping	33
3.4 Peak-force quantitative nanomechanical mapping	33
3.5 Nanoindentation of heterogeneous material	34
3.6 Non-fracture properties	35
3.6.1 Elastic properties	35
3.6.2 Time-dependent properties	36

4	Fracture properties of cementitious materials	37
4.1	Macro-scale fracture properties	37
4.2	Micro-scale fracture properties	39
4.2.1	Sharp indentation-based methods	39
4.2.2	Scratch test	40
4.2.3	Focused Ion Beam technology	42
4.2.4	Micro-beams	43
4.2.5	Micro-pillars	44
4.2.6	Push-to-pull and gripping devices	45
4.2.7	Micro-scale samples prepared by the dicing saw	46
4.2.8	Molecular dynamic models	46
4.2.9	Comparison fracture toughness of cement paste to selected materials at micro-scale	47
5	Materials selection and samples preparation	48
5.1	Material selection	48
5.2	Samples fabrication	48
5.3	Samples preparation for SEM and NI	49
5.4	Image analysis	50
6	Micro-scale properties of selected cementitious composites	51
6.1	Experiments and methods	52
6.1.1	Grid nanoindentation	52
6.1.2	XPM	52
6.1.3	Modulus mapping	53
6.1.4	Phase volumetric characterization by SEM	53
6.2	Mutual comparison of nanoindentation techniques	53
6.2.1	Results of grid nanoindentation	53
6.2.2	Results of XPM	55
6.2.3	Results of MM	59
6.2.4	Local properties of the phases and spatial resolution	60
6.2.5	Acquisition times	61
6.2.6	Strain rate effects	61
6.2.7	Other aspects	65
6.3	Conclusions 1	66
6.4	Evolution of mechanical properties over one year period	67
6.5	Elastic properties of CMS sample	69
6.6	Elastic properties of AAFA sample	70
6.7	Conclusions 2	71

7	Fracture properties of individual phases assessed by micro-cantilever testing	72
7.1	Microcantilever preparation	73
7.1.1	The fabrication process	73
7.1.2	The influence of FIB current on the samples	74
7.2	Testing of micro-beams	75
7.3	Bending response of cement paste micro-beams	78
7.3.1	Cement paste fracture properties measured in the air	78
7.3.2	Cement paste fracture properties measured in the vacuum	79
7.4	Study of heat effects during micro-cantilever preparation	81
7.4.1	SEM observation	81
7.4.2	Model of heat transfer	82
7.4.3	Temperature calculations	84
7.4.4	Effect of FIB generated heat	85
7.5	Fracture properties of AAFA sample	87
7.6	Fracture properties of CMS sample	88
7.7	Other tests and trials	89
7.8	Conclusions	90
8	Fracture toughness of individual material phases assessed by scratch testing and correlated with acoustic emission signal	92
8.1	Experiments and methods	92
8.1.1	Grid microindentation	92
8.1.2	Scratch testing	93
8.1.3	Acoustic emission	94
8.2	Results	94
8.2.1	Results of grid microindentation	94
8.2.2	Results of scratch tests	96
8.3	Conclusions	99
9	Meso-scale properties of cement paste	100
9.1	Motivation	100
9.2	Push-to-Pull experiment	100
9.2.1	Beam fabrication	103
9.2.2	Testing procedure and methods	103
9.2.3	Results and discussion	104
9.3	Pulling machine operating on Arduino platform	105
9.3.1	Construction of the pulling device	106
9.3.2	Experiments and methods	106
9.3.3	Results and discussion	107
9.4	Conclusions for meso-scale	108

10 Relation to other micro-scale techniques	109
10.1 Comparison of micro-scale techniques	109
10.1.1 Level 1	109
10.1.2 Level 2	110
10.1.3 Level 3	110
10.2 Relation to multi-scale models	112
10.2.1 Models for elasticity	112
10.2.2 Models for inelastic properties	113
11 Overall conclusions and future outlook	115
Bibliography	118
