<i>About the companion website</i>	<i>xvii</i>
Chapter 1 The basic principles of photosynthetic energy storage	1
1.1 What is photosynthesis?	1
1.2 Photosynthesis is a solar energy storage process	3
1.3 Where photosynthesis takes place	4
1.4 The four phases of energy storage in photosynthesis	5
References	9
Chapter 2 Photosynthetic organisms and organelles	11
2.1 Introduction	11
2.2 Classification of life	12
2.3 Prokaryotes and eukaryotes	14
2.4 Metabolic patterns among living things	15
2.5 Phototrophic prokaryotes	16
2.6 Photosynthetic eukaryotes	21
References	24
Chapter 3 History and early development of photosynthesis	27
3.1 Van Helmont and the willow tree	27
3.2 Carl Scheele, Joseph Priestley, and the discovery of oxygen	28
3.3 Ingenhousz and the role of light in photosynthesis	29
3.4 Senebier and the role of carbon dioxide	29
3.5 De Saussure and the participation of water	29
3.6 The equation of photosynthesis	30
3.7 Early mechanistic ideas of photosynthesis	31
3.8 The Emerson and Arnold experiments	32
3.9 The controversy over the quantum requirement of photosynthesis	35
3.10 The red drop and the Emerson enhancement effect	35
3.11 Antagonistic effects	37

	3.12 Early formulations of the Z scheme for photosynthesis	37
	3.13 ATP formation	39
	3.14 Carbon fixation	39
	References	39
Chapter 4	Photosynthetic pigments: structure and spectroscopy	41
	4.1 Chemical structures and distribution of chlorophylls and bacteriochlorophylls	41
	4.2 Pheophytins and bacteriopheophytins	47
	4.3 Chlorophyll biosynthesis	48
	4.4 Spectroscopic properties of chlorophylls	51
	4.5 Carotenoids	55
	4.6 Bilins	58
	References	59
Chapter 5	Antenna complexes and energy transfer processes	61
	5.1 General concepts of antennas and a bit of history	61
	5.2 Why antennas?	62
	5.3 Classes of antennas	64
	5.4 Physical principles of antenna function	65
	5.5 Structure and function of selected antenna complexes	73
	5.6 Regulation of antennas	84
	References	87
Chapter 6	Reaction centers and electron transport pathways in anoxygenic phototrophs	91
	6.1 Basic principles of reaction center structure and function	92
	6.2 Development of the reaction center concept	92
	6.3 Purple bacterial reaction centers	93
	6.4 Theoretical analysis of biological electron transfer reactions	98
	6.5 Quinone reductions, the role of the Fe and pathways of proton uptake	101
	6.6 Organization of electron transfer pathways	103
	6.7 Completing the cycle – the cytochrome <i>bc₁</i> complex	105
	6.8 Membrane organization in purple bacteria	109
	6.9 Electron transport in other anoxygenic phototrophic bacteria	110
	References	113
Chapter 7	Reaction centers and electron transfer pathways in oxygenic photosynthetic organisms	117
	7.1 Spatial distribution of electron transport components in thylakoids of oxygenic photosynthetic organisms	117
	7.2 Noncyclic electron flow in oxygenic organisms	119

7.3	Photosystem II overall electron transfer pathway	119
7.4	Photosystem II forms a dimeric supercomplex in the thylakoid membrane	120
7.5	The oxygen-evolving complex and the mechanism of water oxidation by Photosystem II	123
7.6	The structure and function of the cytochrome b_6f complex	128
7.7	Plastocyanin donates electrons to Photosystem I	130
7.8	Photosystem I structure and electron transfer pathway	131
7.9	Ferredoxin and ferredoxin-NADP reductase complete the noncyclic electron transport chain	134
	References	139
Chapter 8	Chemiosmotic coupling and ATP synthesis	145
8.1	Chemical aspects of ATP and the phosphoanhydride bonds	145
8.2	Historical perspective on ATP synthesis	147
8.3	Quantitative formulation of proton motive force	148
8.4	Nomenclature and cellular location of ATP synthase	150
8.5	Structure of ATP synthase	150
8.6	The mechanism of chemiosmotic coupling	153
	References	157
Chapter 9	Carbon metabolism	159
9.1	The Calvin–Benson cycle is the primary photosynthetic carbon fixation pathway	159
9.2	Photorespiration is a wasteful competitive process to carboxylation	173
9.3	The C ₄ carbon cycle minimizes photorespiration	176
9.4	Crassulacean acid metabolism avoids water loss in plants	180
9.5	Algae and cyanobacteria actively concentrate CO ₂	182
9.6	Sucrose and starch synthesis	183
9.7	Other carbon fixation pathways in anoxygenic phototrophs	186
	References	188
Chapter 10	Genetics, assembly, and regulation of photosynthetic systems	191
10.1	Gene organization in anoxygenic photosynthetic bacteria	191
10.2	Gene expression and regulation of purple photosynthetic bacteria	193
10.3	Gene organization in cyanobacteria	194
10.4	Chloroplast genomes	194
10.5	Pathways and mechanisms of protein import and targeting in chloroplasts	195

10.6	Gene regulation and the assembly of photosynthetic complexes in cyanobacteria and chloroplasts	199
10.7	The regulation of oligomeric protein stoichiometry	200
10.8	Assembly, photodamage, and repair of Photosystem II	201
	References	203
Chapter 11	The use of chlorophyll fluorescence to probe photosynthesis	207
11.1	The time course of chlorophyll fluorescence	208
11.2	The use of fluorescence to determine the quantum yield of Photosystem II	209
11.3	Fluorescence detection of nonphotochemical quenching	211
11.4	The physical basis of variable fluorescence	211
	References	212
Chapter 12	Origin and evolution of photosynthesis	215
12.1	Introduction	215
12.2	Early history of the Earth	215
12.3	Origin and early evolution of life	216
12.4	Geological evidence for life and photosynthesis	218
12.5	The nature of the earliest photosynthetic systems	222
12.6	The origin and evolution of metabolic pathways with special reference to chlorophyll biosynthesis	224
12.7	Origin and evolution of photosynthetic pigments	225
12.8	Evolutionary relationships among reaction centers and other electron transport components	229
12.9	Do all photosynthetic reaction centers derive from a common ancestor?	232
12.10	The origin of linked photosystems and oxygen evolution	235
12.11	Origin of the oxygen-evolving complex and the transition to oxygenic photosynthesis	236
12.12	Antenna systems have multiple evolutionary origins	238
12.13	Endosymbiosis and the origin of chloroplasts	241
12.14	Most types of algae are the result of secondary endosymbiosis	244
12.15	Following endosymbiosis, many genes were transferred to the nucleus, and proteins were reimported to the chloroplast	246
12.16	Evolution of carbon metabolism pathways	248
	References	249
Chapter 13	Bioenergy applications and artificial photosynthesis	257
13.1	Introduction	257
13.2	Solar energy conversion	257
13.3	What is the efficiency of natural photosynthesis?	260
13.4	Calculation of the energy storage efficiency of oxygenic photosynthesis	261

13.5	Why is the efficiency of photosynthesis so low?	262
13.6	How might the efficiency of photosynthesis be improved?	263
13.7	Artificial photosynthesis	264
	References	268
