Preface	ix	4. Energy	47
1. Introduction		4.1 Nuclear radiation	49
1. Water pollution defined	1	4.2 Heat	50
2. Growing appreciation for water quality	4	4.3 Atmospheric pressure	52
3. Recent trends	7	4.4 Standard conditions	52
4. Spatial scale	7	5. Scientific advancement	53
5. Stressor-receptor paradigm	7	6. Conclusions	57
6. Systems thinking and sustainability	8	References	58
7. Conclusions	9	4. Biogeochemistry	
References	9	1. Introduction	61
2. Water math		2. The hydrologic cycle	61
1. Introduction	15	2.1 The hydrosphere	62
1.1 Reasoning and logic	16	3. Socrates, a biogeochemist?	64
2. Numbers	17	4. Calculating evapotranspiration	66
2.1 Notation	18	5. Biogeochemical aspects of water	71
2.2 Significant figures	20	6. Scale and complexity of matter and energy cycles	74
2.3 Concentration	22	7. Water in the lithosphere	76
2.4 Temperature	22	8. Carbon equilibrium and cycling	84
2.5 Types of numbers	22	9. Nutrient cycling	88
3. Water pollution analysis	23	9.1 The nitrogen cycle	88
3.1 Data interpretation methods	23	9.2 Interactions between sulfur and nitrogen	92
4. Statistics	24	9.3 The sulfur cycle	93
4.1 Central tendencies	24	10. Biogeochemical cycles and decision making	95
4.2 Root mean square	27	References	96
5. Probability	29	5. Scientific basis for water quality criteria and standards	
5.1 Bayes theorem	33	1. Introduction	101
5.2 Bayesian networks	36	2. Effluent limits	101
6. Cause and effect calculation	39	3. Physicochemical characteristics of water pollutants	102
7. Conclusions	41	3.1 Ionic pollutants	104
References	41	3.2 Dissolved pollutants	108
3. Scientific principles		3.3 Multiphase pollutants	112
1. Introduction	45	3.4 Flow	117
2. Basic scientific principles	45	4. Drinking water standards	117
3. Environmental and experimental conditions	46	5. Conclusions	119
		References	119

6. Climate and weather		5. Organic chemistry	222
1. Introduction	123	6. Conclusions	229
2. Meteorologically important pollutant properties	123	References	229
3. Entropy and enthalpy	131	9. Water pollution biology	
4. Meteorological prediction	132	1. Introduction	231
5. Meteorological phenomena	136	2. Biological organization	232
6. Atmospheric stability	141	3. Cells	233
7. Meteorological models	146	4. Invasive species	235
8. Electromagnetic energy	147	5. Plant physiology and pollution	235
8.1 Adiabatic processes	152	5.1 Diffusive flux	237
8.2 Motion	157	6. Applied biotics	242
8.3 Local winds	158	7. Metrics of biotic condition	245
9. Climate change	162	8. Conclusions	251
10. Conclusions	163	References	251
References	163	10. Surface waters	
7. Water pollution physics		1. Introduction	255
1. Introduction	167	1.1 Surface water stressors	258
2. Physical phases	167	2. Saltwater systems	260
3. Laws of motion	167	2.1 Coastal water	261
3.1 Fluids	168	3. Freshwater systems	261
3.2 Bernoulli's principle	171	3.1 Lakes	262
4. Fluid dynamics in pollutant transport	172	4. Streams	263
4.1 Sorption	178	5. Surface water quality	273
4.2 Diffusive flux	179	5.1 Biochemical oxygen demand	273
4.3 Dispersion	182	5.2 Point and nonpoint sources of sediment	277
4.4 Advective transport	184	5.3 Total maximum daily loading	279
4.5 Eddy diffusion	185	6. Conclusions	284
4.6 Dispersion	186	References	285
4.7 Total mass transfer	187	11. Ground water	
5. Thermodynamics	189	1. Introduction	289
5.1 Enthalpy and entropy	189	2. Ground water balance	292
6. Heat energy	193	3. Ground water interactions	293
7. Electrical energy	196	4. Pollutant transport	298
8. Solution physics	197	5. Ground water treatment	313
9. Conclusions	199	6. Conclusions	316
References	200	References	316
8. Water pollution chemistry		12. Water quality indicators	
1. Introduction	203	1. Introduction	319
2. Reactions	203	2. Oxygen demand	319
2.1 Synthesis or combination	204	2.1 Biochemical oxygen demand	319
2.2 Degradation	205	2.2 Chemical oxygen demand	321
2.3 Single replacement	205	2.3 Sediment oxygen demand	321
2.4 Double replacement	205	3. Conductivity	321
2.5 Precipitation reactions	205	4. Turbidity	322
2.6 Complete combustion	206	5. Biological indicators	323
2.7 Respiration	207	5.1 Biodiversity and species abundance	323
2.8 Photolysis	208	5.2 Enterococci	325
3. Rate law	209		
4. Dissociation and association	211		
4.1 Henderson-Hasselbalch equation	219		
4.2 Hydrolysis	221		

5.3 Net primary productivity and eutrophication	325
6. Conclusions	327
References	327
13. Water quality measurements	
1. Introduction	329
2. Sampling	330
2.1 Data quality objectives	331
2.2 Sampling plan	331
2.3 Monitoring plan example	332
3. Environmental sampling approaches	335
4. Measurement uncertainty and error	337
5. Laboratory analysis	340
5.1 Extraction	340
5.2 Separation science	340
5.3 Detection	341
6. Emerging trends in measurement	344
7. Ethical conduct	345
8. Conclusions	345
References	346
14. Environmental partitioning	
1. Introduction	349
2. Vapor pressure	349
3. Aqueous solubility	352
4. The partition coefficient	354
5. Fugacity	355
6. Pollutant transport	357
7. Sorption	364
8. The octanol-water coefficient	367
9. Henry's law constant	371
10. Partitioning between air and tissue	371
11. Microbial partitioning	378
12. Bioconcentration, bioaccumulation, and biomagnification	380
13. Conclusions	387
References	387
15. Water pollution engineering	
1. Introduction	391
2. Wastewater	391
2.1 Treatment	393
3. On-site treatment technologies	403
4. Treating air pollutants	404
4.1 Particle collection	404
4.2 Treating vapors and gases	410
5. Water treatment	413
6. Conclusions	414
References	414

16. Ground water remediation	
1. Introduction	419
2. Natural attenuation	422
3. Treatment basics	423
3.1 Leachability testing prior to treatment	424
4. Thermal destruction	424
4.1 Thermal technologies	427
4.2 Destruction and removal efficiency	430
5. Solidification and stabilization	431
6. Specific technologies	431
6.1 Air stripping	432
6.2 Air sparging	432
6.3 Fracturing remediation	432
6.4 Bioremediation	433
6.5 Phyto-remediation	438
6.6 Combined technologies	440
7. Disposal	441
8. Conclusion	442
References	443
17. Risk assessment	
1. Introduction	447
2. Hazard identification	449
2.1 Thresholds	449
2.2 Microbial hazard classification	452
2.3 Toxicokinetics	452
3. Dose-response	453
3.1 Reference dose	456
4. Exposure estimation	458
5. Human risk characterization	459
5.1 Unit risk estimates	461
5.2 Risk uncertainties	462
5.3 Hazard index and hazard quotient	463
5.4 Estimating risks	463
6. Ecological risk assessment	466
7. Conclusions	469
References	469
18. Water quality accountability	
1. Introduction	477
2. Cause and effect	477
2.1 Strength of association	478
2.2 Temporality	478
2.3 Biologic gradient	478
2.4 Plausibility	478
2.5 Coherence	478
2.6 Experimentation	479
2.7 Analogy	479

3. Reliability	479	9. Life cycle comparisons	496
4. Resilience	482	9.1 Life cycle costing	498
5. Redundancy and robustness	483	10. Conclusions	499
6. Engineering economics	484	References	499
6.1 Cash flow	484		
6.2 Discounting	486	19. The future	
7. Comparing alternatives	489		
7.1 Social costs	489	Glossary of water quality terms	505
7.2 Types of cost estimates	490	Appendix	547
7.3 Proposal review	490	Abbreviations and symbols	559
8. Replacement cost analysis	492	Index	577
8.1 RCA techniques	496
