General Basics	1
1.1 Micrometeorology	1
1.2 Atmospheric Scales	6
1.3 Atmospheric Boundary Layer	8
1.4 Energy and Radiation Fluxes at the Earth's Surface	10
1.4.1 Net Radiation at the Earth's Surface	11
1.4.2 Energy Balance at the Earth's Surface	16
1.4.3 Ground Heat Flux and Ground Heat Storage	19
1.4.4 Turbulent Fluxes	23
1.5 Water Balance Equation	27
References	29
Basic Equations of Atmospheric Turbulence	39
2.1 Equation of Motion	39
2.1.1 Navier-Stokes Equation of Mean Motion	39
2.1.2 Turbulent Equation of Motion	40
2.1.3 Closure Techniques	46
2.2 Equation of the Turbulence Kinetic Energy	49
2.3 Flux-Gradient Similarity	51
2.3.1 Profile Equations for Neutral Stratification	51
2.3.2 Integration of the Profile Equation: Roughness Length and Zero-Plane Displacement	56
2.3.3 Monin-Obukhov's Similarity Theory	60
2.3.4 Bowen-Ratio Similarity	71
2.4 Flux-Variance Similarity	72
2.5 Turbulence Spectrum	74
2.6 Atmospheric Boundary Layer	81
2.6.1 Mixed Layer Height	82
2.6.2 Resistance Law	83
2.6.3 Integral Turbulence Characteristics	84

Thomas Foken is a retired Professor of micrometeorology at the University of Bayreuth. He received his doctorate in meteorology at the University of Leipzig in 1978 and the second doctoral degree from the Humboldt University of Berlin in 1990. He was the head of Laboratories at the Meteorological Observatories at Potsdam (1981–1994) and Lindenberg (1994–1997) of the Meteorological Service of the GDR and the German Meteorological Service (DWD). His appointment as Professor of Micrometeorology at the University of Bayreuth came in 1997. His research interests include the interaction between the Earth's surface and the atmosphere and the measurement and modelling of energy and matter fluxes, with a strong focus on experimental meteorology. His scientific contributions have been recognized through various international awards.

Matthias Mauder is Professor of Meteorology at the TUD Dresden University of Technology. He received his doctorate in micrometeorology at the University of Bayreuth in 2006. As a post-doc, he developed new methods for the analysis of airborne eddy-covariance measurements and multi-tower measurements at the Research Branch Department of Agriculture in Ottawa, Canada. Afterwards, he headed the group on transport processes in the atmospheric boundary layer at the Karlsruhe Institute of Technology. In his current research, he and his team generally aim to combine different observational techniques with numerical modelling, in order to improve our understanding of turbulent transport processes in studies on the carbon and water cycle, regional climate and climate adaptation, and urban climate.
