Preface	vii
<b>Part 1. Very weak, weak and strong solutions to the instationary Navier–Stokes system</b>	
REINHARD FARWIG, HIDEO KOZONO, HERMANN SOHR	1
Chapter 1. Introduction	5
1. Weak solutions in the sense of Leray–Hopf	5
2. Regular solutions	8
3. The concept of very weak solutions	10
4. Preliminaries	13
Chapter 2. Theory of very weak solutions	17
1. The stationary Stokes system	17
2. The stationary Navier–Stokes system	23
3. The instationary Stokes system	26
4. The instationary Navier–Stokes system	29
Chapter 3. Regularity of weak solutions	33
1. Local in time regularity	33
2. Energy–based criteria for regularity	40
3. Local in space–time regularity	43
Bibliography	51
<b>Part 2. Qualitative and quantitative aspects of curvature driven flows of planar curves</b>	
DANIEL ŠEVČOVIČ	55
Preface	59
Chapter 1. Introduction	61
1. Mathematical models leading to curvature driven flows of planar curves	61
2. Methodology	63
3. Numerical techniques	63
Chapter 2. Preliminaries	65
1. Notations and elements of differential geometry	65
2. Governing equations	67

3. First integrals for geometric quantities	69
4. Gage-Hamilton and Grayson's theorems	70
Chapter 3. Qualitative behavior of solutions	75
1. Local existence of smooth solutions	75
Chapter 4. Level set methods for curvature driven flows of planar curves	85
1. Level set representation of Jordan curves in the plane	85
2. Viscosity solutions to the level set equation	88
3. Numerical methods	90
Chapter 5. Numerical methods for the direct approach	93
1. A role of the choice of a suitable tangential velocity	93
2. Flowing finite volume approximation scheme	96
Chapter 6. Applications of curvature driven flows	103
1. Computation of curvature driven evolution of planar curves with external force	103
2. Flows of curves on a surface driven by the geodesic curvature	103
3. Applications in the theory of image segmentation	108
Bibliography	115
<b>Part 3. The Navier-Stokes equations with particle methods</b>	
WERNER VARNHORN	121
Chapter 1. The Navier-Stokes equations with particle methods	125
1. Introduction	125
2. An initial value problem	128
3. Approximation of the convective term	130
4. Construction of the initial data	133
5. Strongly $H_2$ -continuous solutions	134
6. Solutions compatible at initial time $t = 0$	140
7. Global solutions	143
8. Global convergence to a weak solution of $(N_0)$	145
9. Local strong convergence	153
Bibliography	157
<b>Part 4. Qualitative theory of semilinear parabolic equations and systems</b>	
PAVOL QUITTNER	159
Chapter 1. Qualitative theory of semilinear parabolic equations and systems	163
1. Introduction	163
2. The role of $\Delta$ in modeling	164
3. Basic tools	166
4. Well-posedness	171
5. Stability and global existence for small data	179

6. Blow-up in $L^\infty$ and gradient blow-up	181
7. The role of diffusion in blow-up	186
8. Borderline between global existence and blow-up	192
9. Universal bounds and blow-up rates	194
Appendix	197
Bibliography	199
<b>Part 5. Nonlinear Fredholm operators and PDEs</b> PATRICK J. RABIER	201
Preface	205
Chapter 1. Degree for Fredholm mappings of index 0	207
1. Fredholm operators	207
2. Classical degree theories	208
3. A $\mathbb{Z}$ -valued degree for Fredholm mappings of index 0	210
4. Comments and references	216
Chapter 2. Fredholmness and properness of differential operators	219
1. Fredholmness of elliptic operators on $\mathbb{R}^N$	220
2. Properness of nonlinear elliptic operators on $\mathbb{R}^N$	223
3. The Navier–Stokes problem on exterior domains	226
4. Fredholmness of evolution operators	229
Bibliography	237
