<i>Introduction</i>	ix
1. General principles	1
1.1 Low sample size reduces statistical power	1
1.1.1 The statistical power of your study	1
1.1.2 Improving the power of your study	3
1.1.3 Interpreting your study in the light of low power	7
1.2 A small sample is more likely to be unrepresentative	8
1.3 Summary statistics can be less helpful	9
1.4 Effect sizes might be inflated	9
1.5 Meta-analysis may be more important	10
2. Note on permutation and bootstrap tests	11
2.1 Permutation tests	12
2.2 Bootstrap tests	15
3. A single sample of continuous data	19
3.1 Paired $t$ test	20
3.2 Sign test	23
3.3 Wilcoxon signed rank test	25
3.4 Confidence intervals	26
3.5 Bootstrap tests and confidence intervals	29
4. Comparing continuous data across levels of one or more factors	32
4.1 Two-sample comparisons	32
4.1.1 Tests for the location-shift problem	32
4.1.2 Unequal variances	39
4.1.3 Tests for a difference in variability	45
4.1.4 General alternative	45
4.2 More than two samples	49
4.3 Trend tests	54
4.4 More complex designs	56
4.4.1 Comparing continuous data across levels of two or more factors	56
4.4.2 Continuous data across factors and covariates	58
5. Correlation and regression	59
5.1 Correlation	59
5.2 Regression	63

6. Binomial data	71
6.1 A single sample of binomial data	71
6.2 Two samples: confidence intervals for binomial variables	73
6.2.1 Difference between proportions	74
6.2.2 Relative risk (also called risk ratio)	75
6.2.3 Odds ratio	76
6.2.4 The number needed to treat (NNT)	78
6.3 Testing the null hypothesis of identical proportions	78
6.3.1 Comparing two proportions	78
6.3.2 Comparing more than two proportions	82
6.4 Paired binomial data	83
6.5 Association and agreement in paired binomial data	86
6.6 Logistic regression	87
7. Multinomial data	93
7.1 A single sample over unordered levels of one factor	93
7.2 A single sample over ordered levels of one factor	97
7.3 Comparing two or more samples over ordered levels of one factor	100
7.4 Generalising to $r$ samples over a factor with $c$ unordered levels	102
7.5 An $r \times c$ contingency table where both factors are ordered	104
8. Sequential analysis and adaptive designs	105
8.1 Group-sequential designs	105
8.2 Adaptive designs	109
9. Meta-analysis	114
10. Multiple testing	122
11. Bayesian analysis	127
