Introduction		11
Part I Formalism		
1 Introduction to general relativity 1: Kinematics and Einstein equations		5
1.1 Intrinsically curved spacetime and the geometry of general relativity		5
1.1.1 Special relativity		5
1.1.2 General relativity		6
1.2 Einstein's theory of general relativity		8
1.3 Kinematics		10
1.4 Actions in general relativity		13
1.5 The Einstein–Hilbert action		13
2 Introduction to general relativity 2: Vielbein and spin connection, anti-de Sitter space, black holes		18
2.1 The vielbein–spin connection formulation of general relativity		18
2.2 Anti-de Sitter space		23
2.3 Cosmological constant		25
2.4 Black holes		26
3 Introduction to supersymmetry 1: Wess–Zumino models, on-shell and off-shell supersymmetry		30
3.1 Supersymmetry: a Bose–Fermi symmetry		30
3.2 Spinors in general dimensions		31
3.3 The susy algebra		34
3.4 Two-dimensional Wess–Zumino model and on-shell susy		34
3.4.1 Majorana spinor identities		36
3.4.2 Invariance of the action and susy algebra		36
3.4.3 Fierz identities (Fierz recouplings)		37
3.4.4 Closure of algebra on ψ		38
3.5 Two-dimensional WZ model: off-shell susy		38
3.6 Four dimensions: free off-shell WZ model		40

4	Introduction to supersymmetry 2: Multiplets and extended supersymmetry	43
4.1	Two-component notation for spinors: dotted and undotted indices	43
4.2	Massless irreducible representations	44
4.3	Massive representations	46
4.3.1	Representations without central charges	46
4.3.2	Massive representations with central charges	47
4.3.3	R-symmetry	48
4.4	Lagrangians for the multiplets in $d = 4$	48
4.4.1	Chiral (WZ) multiplet	48
4.4.2	The $\mathcal{N} = 1$ vector (YM) multiplet	49
4.4.3	Coupling to matter (chiral multiplets)	50
4.5	$\mathcal{N} = 2$ susy models	52
4.6	$\mathcal{N} = 4$ SYM	52
5	Introduction to supersymmetry 3: Superspace formalism in $d = 4$: Perturbative susy breaking	56
5.1	Superspace and superfields	56
5.2	Actions in terms of superfields: chiral multiplets	58
5.3	Vector multiplet	60
5.4	$\mathcal{N} = 2$ superspace	62
5.5	Perturbative supersymmetry breaking	64
5.5.1	Witten index	64
5.5.2	Tree-level susy breaking	65
6	Four-dimensional on-shell supergravity and how to count degrees of freedom	69
6.1	Degrees of freedom counting	69
6.1.1	Off-shell counting	69
6.1.2	On-shell counting	70
6.2	Supergravity	71
6.3	$\mathcal{N} = 1$ on-shell four-dimensional supergravity	72
6.3.1	Susy invariance of the $S_{\mathcal{N}=1}$ action in 1.5-order formalism	76
7	Three-dimensional $\mathcal{N} = 1$ off-shell supergravity	79
7.1	Action and symmetries	79
7.2	Supersymmetry transformation rules	81
7.3	The susy algebra	84
8	Coset theory and rigid superspace	88
8.1	Coset theory	88
8.2	Parallel transport and general relativity on the coset manifold	92
8.3	H -covariant Lie derivatives	94
8.4	Rigid superspace from the coset formalism	95

9 Covariant formulation of YM in rigid superspace and local superspace formalisms	100
9.1 Rigid superspace as a coset: transformation rules and constraints	100
9.2 Covariant formulation of four-dimensional YM in rigid superspace	102
9.3 Solving the constraints and Bianchi identity and relation to prepotential formalism	104
9.4 Coset approach to three-dimensional supergravity	107
9.5 Super-geometric approach	112
10 $\mathcal{N} = 1$ Four-dimensional off-shell supergravity	114
10.1 Supersymmetry transformation rules	114
10.2 Action	115
10.3 Susy algebra closure	116
11 $\mathcal{N} = 1$ Four-dimensional supergravity in superspace	121
11.1 Super-geometric approach: invariances, gauge choices, and fields	121
11.2 Constraints	122
11.3 Solution of the constraints and Bianchis	124
12 Superspace actions and coupling supergravity with matter	128
12.1 Review of YM superfields in rigid superspace	128
12.2 YM superfields in curved superspace	130
12.3 Invariant measures	130
12.4 Supergravity actions	132
12.5 Supergravity coupled to matter: terms in the component action	134
13 Kaluza–Klein (KK)-dimensional reduction and examples	137
13.1 Kaluza–Klein compactification	137
13.2 Metrics in KK theory	139
13.3 Fields with (Lorentz) spin in KK theory	141
13.4 The original KK theory: compactification on S^1	144
13.5 Some general properties of KK reductions	145
14 Spherical harmonics and the KK expansion on sphere, coset, and group spaces	148
14.1 Spherical harmonics	148
14.2 Coset theory	150
14.3 Examples of spherical harmonics	151
14.4 KK decomposition	155
14.5 Spherical harmonics on particular coset manifolds	157
14.5.1 Group spaces	157
15 $\mathcal{N} = 2$ sugra in 4 dimensions, general sugra theories, and $\mathcal{N} = 1$ sugra in 11 dimensions	162
15.1 $\mathcal{N} = 2$ supergravity and special geometry	162
15.1.1 $\mathcal{N} = 2$ rigid supersymmetry	162

15.1.2	Special geometry	163
15.1.3	Very special geometry and duality symmetries	167
15.2	Other supergravity theories	169
15.3	$\mathcal{N} = 1$ supergravity in 11 dimensions	170
15.4	Off-shell and superspace	172
Part II Applications		
16	$AdS_7 \times S^4$ nonlinear KK compactification of 11-dimensional supergravity and related notions	177
16.1	$\mathcal{N} = 1$ 11-dimensional supergravity and compactifications	177
16.2	First-order formulation of 11-dimensional supergravity	179
16.3	Consistent truncations and nonlinear ansätze	180
16.4	Linearized ansatz for reduction on S^4	182
16.5	Review of spherical harmonics on S^4	184
16.6	Nonlinear ansatz	186
16.7	* Gauged supergravities, maximal supergravities in various dimensions, and gaugings	187
16.7.1	$d = 4$ $\mathcal{N} = 8$ (maximal) gauged supergravity	188
16.7.2	$d = 5$ $\mathcal{N} = 8$ (maximal) gauged supergravity	191
16.7.3	$d = 7$ $\mathcal{N} = 4$ (maximal) gauged supergravity	193
16.7.4	Massive type IIA supergravity in $d = 10$	195
16.7.5	Type IIB supergravity in $d = 10$	197
16.7.6	Other gaugings: $ISO(7)$ example	199
16.7.7	Some general properties of gaugings	199
16.8	* Modified supergravities in 10 and 11 dimensions: modified “local Lorentz” covariance, “exceptional field theory,” and the geometric approach to supergravity	201
16.8.1	Eleven-dimensional supergravity with $SO(3, 1) \times SU(8)$ (“local Lorentz”) covariance	201
16.8.2	Exceptional field theory	203
16.8.3	The geometric approach to supergravity: d’Auria and Fré’s 11-dimensional supergravity with $Osp(1 32)$ invariance	205
17	(Abelian and nonabelian) T-dualities and other solution-generating techniques: TsT, $O(d, d)$, and null Melvin twist	210
17.1	Abelian T-duality	210
17.2	Nonabelian T-duality	212
17.3	TsT transformation	216
17.3.1	Example	217
17.4	$O(d, d)$ transformation	218
17.5	Null Melvin twist	219

18	Extremal and black p-brane solutions of supergravity; Tseytlin's harmonic function rule	223
18.1	Introduction	223
18.2	Actions and equations of motion	225
18.3	The electric p -brane solution	227
18.4	Magnetic p -branes and duality	231
18.4.1	Duality	233
18.5	Generalizations: black p -branes	234
18.5.1	D- p -branes in 10 dimensions	235
18.5.2	Fundamental string and magnetic (NS)5-brane solutions	235
18.6	Tseytlin's harmonic function rule for intersecting branes	236
19	Supersymmetry of solutions, classification via susy algebra, intersecting brane solutions	240
19.1	Algebra vs. susy background	240
19.2	Mass of solutions	241
19.3	Supersymmetry of solutions	242
19.4	Supergravity solutions corresponding to fundamental objects = states in string theory	245
19.5	Classification of solutions by the susy algebra	248
19.6	Intersecting brane solutions	250
20	U-duality group acting on supergravity theories and on solutions, M theory unification	253
20.1	Generalities	253
20.2	M theory unification	254
20.3	String duality web	257
20.4	U-duality from M theory	260
21	Gravity duals: Decoupling limit and Penrose limits on solutions and algebras	266
21.1	The AdS/CFT correspondence	266
21.2	M theory cases	268
21.3	Gravity dual of N extremal D p -branes	270
21.3.1	Observations on supersymmetry	272
21.4	Penrose limits of AdS/CFT dualities	272
21.4.1	General theory	275
21.4.2	Penrose limit on the isometry group and algebra	279
22	Supersymmetric AdS/CFT gravity dual pairs and their deformations (susy, marginal, integrable)	283
22.1	Supersymmetric AdS/CFT maps	283
22.2	Supersymmetric and integrable deformations	285
22.2.1	β deformation of $\mathcal{N} = 4$ SYM	285
22.2.2	γ deformation (generalization with three parameters)	286
22.3	η and λ deformations	288
22.4	Yang–Baxter deformations	290
22.5	Generalized supergravity equations	292

23	Extremal black holes, the attractor mechanism, and holography	295
23.1	The attractor mechanism	295
23.1.1	Four-dimensional $\mathcal{N} = 2$ case (the original one)	295
23.2	Interpretation and Sen's entropy function formalism	298
23.3	Attractors in five-dimensional gauged supergravity and holography	301
23.3.1	Five-dimensional gauged supergravity attractors	301
23.3.2	Embedding in string theory and AdS/CFT	304
24	Supersymmetric string (NS-R, GS, Berkovits) and supergravity on the worldsheet vs. spacetime supergravity	309
24.1	Particle actions	309
24.2	Bosonic string	310
24.2.1	Actions and equations of motion	311
24.2.2	Constraints, oscillators, and quantization	313
24.2.3	Background fields	314
24.3	Supersymmetric strings	315
24.3.1	The superparticle	315
24.3.2	The GS superstring	316
24.3.3	NSR (Spinning) string	320
24.3.4	Berkovits formalism	321
25	Kappa symmetry and spacetime supergravity equations of motion; superembedding formalism	325
25.1	WZ terms and superstrings	325
25.2	Super- p -branes	327
25.2.1	Actions	327
25.2.2	Brane scan and kappa symmetry	328
25.2.3	Curved superspace and sugra equations from kappa symmetry	329
25.3	Superembedding formalism	331
25.3.1	Superembedding conditions	331
25.3.2	Particle embedding	332
25.3.3	Examples	335
25.3.4	Superstrings	337
26	Supergravity and cosmological inflation models	341
26.1	$\mathcal{N} = 1$ supergravity coupled with a single chiral superfield Φ	342
26.2	D-term inflation	344
26.2.1	Example: the original FI model	345
26.3	Field redefinitions	345
26.4	Example of supergravity model with $\epsilon, \eta \ll 1$	346
26.4.1	First try	346
26.4.2	Modified example	347
26.5	Special embedding of inflationary potentials in supergravity	348
26.6	Kalosh and Linde's " α attractors" in $\mathcal{N} = 1$ supergravity	350

27 Maldacena–Núñez and supergravity no-go theorems; loopholes	353
27.1 No-go theorem	353
27.2 No Minkowski or de Sitter compactifications of massive type IIA supergravity	356
27.3 No RS solution in $d = 5$ gauged supergravity	357
27.4 The “swampland conjecture”	359
27.4.1 First: scattered (sporadic) results	360
27.4.2 Second: more general no-go theorem	361
28 Witten’s positive energy theorem in general relativity and connection with supergravity	365
28.1 Setup	365
28.2 Sketch of the proof	366
28.3 Proof	367
28.3.1 Step 1	367
28.3.2 Step 2	368
28.3.3 Step 3	369
28.3.4 Step 4	372
28.4 Connection to supergravity	372
29 Compactification of low-energy string theory	378
29.1 Setup and conditions for compactification	378
29.2 Topology	380
29.2.1 Spinors and holonomies	380
29.2.2 Kähler and Calabi–Yau manifolds	381
29.2.3 Cohomology, homology, and mass spectra	382
29.3 Moduli space of CY_3	383
29.3.1 Complex structure moduli	383
29.3.2 Kähler structure moduli	384
29.4 Type IIB on CY_3	385
29.5 Heterotic $E_8 \times E_8$ on CY_3	386
30 Toward realistic embeddings of the Standard Model using supergravity	390
30.1 The Standard Model	390
30.1.1 Particle spectrum	390
30.1.2 Symmetries	391
30.1.3 Spinors and notation	391
30.1.4 Spectrum split into representations	392
30.1.5 The Lagrangian	393
30.2 Grand Unified Theories	396
30.2.1 $SU(5)$ unification	396
30.2.2 $SO(10)$ unification	397
30.2.3 Other groups	397

30.3	Minimal Supersymmetric Standard Model	397
30.3.1	Minimal supergravity	399
30.4	New low-energy string (supergravity) constructions	399
31	Minimal sugra, phenomenology, and models of susy breaking	403
31.1	Masses and MSSM parameters	403
31.2	Minimal Supergravity (MinSugra)	404
31.3	Susy breaking	405
31.4	Susy breaking mechanisms for the MSSM and MinSugra	406
31.5	Susy breaking in MinSugra	409
31.6	Polonyi model for susy breaking: hidden sector + gravity mediation	411
