

PREFACE	9
Acknowledgements	11
1. INTRODUCTION	13
1.1 Basic characteristics of the elements in human organisms and skeletons	13
2. HUMAN BONE HEALTH IN RELATION TO THE ELEMENTAL COMPOSITION OF THE SOIL IN VARIOUS GEOGRAPHICAL REGIONS – the importance of geomedicine and geobiology	17
2.1 Chemical changes in the course of soil formation	17
2.2 Trace elements and plants	18
2.3 Trace elements in animals	20
2.4 Diseases at disturbances in intake of minerals in humans and the principal regions of deficiency of elements in the world	24
2.5 Geomedical conclusion for future possibilities of employment of geological influences on bone structure	33
3. ATTAINABILITY OF ELEMENTS FROM FOOD	35
3.1 Trace elements from drinking water	36
4. DEPOSITION OF ELEMENTS INTO BONE TISSUE	37
4.0.1 Metabolism of trace elements shown on the model of tin	37
4.1 Absorption into the digestive system	39
4.2 Absorption through the lungs	41
4.3 Absorption through the skin	42
4.4 Penetration through the placenta	42
4.5 Transport and distribution in blood	48
4.6 Secretion	49
4.6.1 Secretion by stool	49
4.6.2 Secretion with urine	50
4.6.3 Secretion with the mother's milk	50
4.6.4 Secretion through other means	50
5. BASIC BUILDING ELEMENTS OF BONE	51
5.1 Inorganic component of bone – hydroxyapatite	51
5.2 Mineralization of bone	53
5.3 Organic component of bone – collagen	54
5.4 Non-collagenous components of basic material	56
5.5 Bone cells	57
5.6 Bone matrix	58
5.7 Kinds of bone tissue	58
6. TRACE ELEMENTS IN ONTOGENY AND PHYSIOLOGY OF BONE TISSUE	60
6.1 Genetic regulation of skeletal patterning	60
6.2 Distribution of trace elements in the bones of the fetus shown on the model of tin	64

6.2.1 Tin lateral difference in the long bones of the fetus	64
6.2.2 Tin distribution between the centre and end parts of the femur	65
6.3 Distribution of elements in the long bones of adults	66
6.3.1 Tin in the femurs and tibiae of cadavers of recent population	66
6.3.2 Dependence of tin concentration on age	68
6.4 Trace elements during skeleton growth	69
6.4.1 Lateralisation during the growth of the skeleton	72
6.5 Hormonal regulation of elemental homeostasis in bone tissue	75
6.6 Remodeling of the bone and its influence from aluminium	77
6.7 Bone loss in the skeleton	79
6.8 Osteoporosis	79
6.8.1 Premature osteoporosis	81
6.8.2 Monitoring of trace elements in the hip bone	82
7. TRACE ELEMENTS AND THE EUROPEAN SKELETON THROUGH 7000 YEARS	84
7.1 Zinc in skeletal sets	84
7.2 Strontium in skeletal sets	86
7.3 Lead in skeletal sets	86
7.4 Tin in skeletal sets from the 1 st to 5 th centuries A. D.	89
7.4.1 Tin as a contaminant	90
7.4.2 Tin in skeletal sets: exchange of contamination matter in the diet of the 20 th century	91
8. RECONSTRUCTION OF DIETARY TRENDS BASED ON CHEMICAL ANALYSIS OF ELEMENTS	92
8.1 Cycle of strontium in the biosphere	92
8.1.1 Paleodiet and bone strontium	93
8.2 Further elements employable for the reconstruction of diet	94
8.3 Basic studies dealing with learning prehistoric dietary regimes	95
8.4 Techniques for trace elemental analyses	96
8.4.1 Sampling and sample preparation	97
8.4.1.1 Analytical Instrumentation	97
8.4.2 Diagenetic Processes	98
8.4.3 Interpretation	98
8.4.4 Applications of trace element analyses in reconstructing prehistoric diet	99
8.4.4.1 Distinguishing plant and animal supply in diet	99
8.4.4.2 Distinguishing marine versus terrestrial resources	99
8.4.4.3 Trace elements in weaning and milking	100
8.4.4.4 Distinguishing mobility	100
8.5 Techniques for stable isotope analysis	100
8.5.1 Sampling and sample preparation	100
8.5.2 Diagenesis	101
8.5.3 Interpretation	101
8.5.4 Applications of stable isotope analyses to reconstructing prehistoric diet	101
8.5.4.1 Identification of C ₃ and C ₄ plants	102
8.5.4.2 Distinguishing diets based on marine and terrestrial resources	102
8.5.4.3 Stable isotope analyses in weaning and milking	104
8.5.4.4 Distinguishing mobility	104
8.6 Why the elemental and isotopic analyses are complementary, not redundant techniques?	105
9. SOME HUMAN DIETARY PATTERNS IN EUROPE	106
9.1 Mesolithic diet	106
9.2 Neolithic diet	108
9.3 Bronze age diet and cannibalism	117
9.4 La Tène era diet	127
9.4.1 Differences in models of Celtic and Germanic diet patterns	130
9.4.2 Diet and warriors	130

9.4.3 Regional comparison of lead concentrations in skeletons of La Tène	132
9.4.4 Social status and variation in lead concentrations within individual burial grounds	132
9.4.5 Sources of lead in La Tène skeletons	133
9.4.6 Distinguishing social stratification	134
9.4.7 La Tène social stratification based on comparisons of written reports, archaeological finds and bone analyses	141
9.4.8 Comparison of the social groups of the Hallstatt and La Tène period	142
9.4.9 Social development in the Hallstatt – La Tène period	142
9.5 Roman diet	145
9.5.1 Germanic sites	145
9.5.2 Legionary camps	153
9.5.3 Sarmatians in Hungary I	154
9.5.4 The role of Ag and Pb in the Roman economy	155
9.5.5 Lead in skeletal sets from the Roman Era	157
9.5.6 Lead as a civilisation element and diet contaminant	158
9.6 Migration period diet	162
9.6.1 Hun's (Hunnu) nomadic population	163
9.6.2 Sarmatians in Hungary II	165
9.6.3 Prelangobardic population (probably Heruls)	166
9.6 Medieval diet	169
9.7.1 Slavic diet pattern	170
9.8 Recent diet	177
9.8.1 Lifestyle and dietary habits of children	177
9.8.2 Future options	178
10. CONCLUSION	179
BIBLIOGRAPHY	183
Glossary of analytical instrumentation	207
Subject Index	210
