Preface to the Third Edition	xi
Acknowledgments	xii
Author	xiii
I Numerical Model Generation	1
1 Finite Element Analysis	3
1.1 Solution of boundary value problems	3
1.2 Finite element shape functions	6
1.3 Finite element basis functions	9
1.4 Assembly of finite element matrices	12
1.5 Element matrix generation	15
1.6 Local to global coordinate transformation	19
1.7 A linear quadrilateral finite element	20
1.8 Quadratic finite elements	26
References	29
2 Finite Element Model Generation	31
2.1 Bezier spline approximation	31
2.2 Bezier surfaces	37
2.3 B-spline technology	40
2.4 Computational example	43
2.5 NURBS objects	48
2.6 Geometric model discretization	50
2.7 Delaunay mesh generation	51
2.8 Model generation case study	54
References	57
3 Modeling of Physical Phenomena	59
3.1 Lagrange's equations of motion	59
3.2 Continuum mechanical systems	61
3.3 Finite element analysis of elastic continuum	63
3.4 A tetrahedral finite element	65
3.5 Equation of motion of mechanical system	69
3.6 Transformation to frequency domain	71
References	74

4	Constraints and Boundary Conditions	75
4.1	The concept of multi-point constraints	76
4.2	The elimination of multi-point constraints	79
4.3	An axial bar element	82
4.4	The concept of single-point constraints	85
4.5	The elimination of single-point constraints	86
4.6	Rigid body motion support	88
4.7	Constraint augmentation approach	90
	References	92
5	Singularity Detection of Finite Element Models	93
5.1	Local singularities	93
5.2	Global singularities	97
5.3	Massless degrees of freedom	99
5.4	Massless mechanisms	100
5.5	Industrial case studies	102
	References	104
6	Coupling Physical Phenomena	105
6.1	Fluid-structure interaction	105
6.2	A hexahedral finite element	106
6.3	Fluid finite elements	109
6.4	Coupling structure with compressible fluid	111
6.5	Coupling structure with incompressible fluid	112
6.6	Structural acoustic case study	113
	References	115
II	Computational Reduction Techniques	117
7	Matrix Factorization and Linear Systems	119
7.1	Finite element matrix reordering	119
7.2	Sparse matrix factorization	122
7.3	Multi-frontal factorization	124
7.4	Linear system solution	126
7.5	Distributed factorization and solution	127
7.6	Factorization and solution case studies	130
7.7	Iterative solution of linear systems	134
7.8	Preconditioned iterative solution technique	137
	References	139
8	Static Condensation	141
8.1	Single-level, single-component condensation	141
8.2	Computational example	144
8.3	Single-level, multiple-component condensation	147

8.4	Multiple-level static condensation	152
8.5	Static condensation case study	155
	References	158
9	Real Spectral Computations	159
9.1	Spectral transformation	159
9.2	Lanczos reduction	161
9.3	Generalized eigenvalue problem	164
9.4	Eigensolution computation	166
9.5	Distributed eigenvalue computation	168
9.6	Dense eigenvalue analysis	172
9.7	Householder reduction technique	175
9.8	Normal modes analysis case studies	177
	References	181
10	Complex Spectral Computations	183
10.1	Complex spectral transformation	183
10.2	Biorthogonal Lanczos reduction	184
10.3	Implicit operator multiplication	186
10.4	Recovery of physical solution	188
10.5	Solution evaluation	190
10.6	Reduction to Hessenberg form	191
10.7	Rotating component application	192
10.8	Complex modal analysis case studies	196
	References	199
11	Dynamic Reduction	201
11.1	Single-level, single-component dynamic reduction	201
11.2	Accuracy of dynamic reduction	203
11.3	Computational example	206
11.4	Single-level, multiple-component dynamic reduction	208
11.5	Multiple-level dynamic reduction	210
11.6	Multi-body analysis application	212
	References	215
12	Component Mode Synthesis	217
12.1	Single-level, single-component modal synthesis	217
12.2	Mixed boundary component mode reduction	219
12.3	Computational example	222
12.4	Single-level, multiple-component modal synthesis	225
12.5	Multiple-level modal synthesis	228
12.6	Component mode synthesis case study	230
	References	232

13 Modal Solution Technique 237

13.1	Modal solution	237
13.2	Truncation error in modal solution	239
13.3	The method of residual flexibility	241
13.4	The method of mode acceleration	245
13.5	Coupled modal solution application	246
13.6	Modal contributions and energies	247
	References	250

14 Transient Response Analysis 251

14.1	The central difference method	251
14.2	The Newmark method	252
14.3	Starting conditions and time step changes	254
14.4	Stability of time integration techniques	255
14.5	Transient response case study	258
14.6	State-space formulation	259
	References	262

15 Frequency Domain Analysis 263

15.1	Direct and modal frequency response analysis	263
15.2	Reduced-order frequency response analysis	264
15.3	Accuracy of reduced-order solution	267
15.4	Frequency response case study	268
15.5	Enforced motion application	269
	References	271

16 Nonlinear Analysis 273

16.1	Introduction to nonlinear analysis	273
16.2	Geometric nonlinearity	275
16.3	Newton-Raphson methods	278
16.4	Quasi-Newton iteration techniques	282
16.5	Convergence criteria	284
16.6	Computational example	285
16.7	Nonlinear dynamics	287
	References	288

17 Sensitivity and Optimization 289

17.1	Design sensitivity	289
17.2	Design optimization	290
17.3	Planar bending of the bar	294

17.4	Computational example	297
17.5	Eigenfunction sensitivities	302
17.6	Variational analysis	304
	References	308
18	Engineering Result Computations	309
18.1	Displacement recovery	309
18.2	Stress calculation	311
18.3	Nodal data interpolation	312
18.4	Level curve computation	314
18.5	Engineering analysis case study	316
	References	319
IV	Advanced Industrial Solutions	321
19	Heat Transfer	323
19.1	Heat conduction phenomenon	323
19.2	Weak form of heat equation	324
19.3	Capacity matrix	325
19.4	Conduction matrix	326
19.5	Heat source and boundary condition matrices	327
19.6	Heat conduction analysis	328
19.7	Thermo-elastic application	331
	References	333
20	Wave Propagation	334
20.1	The wave propagation phenomenon	334
20.2	Weighted residual form	335
20.3	Finite element discretization	336
20.4	Time domain interpolation	338
20.5	Governing equation	340
20.6	Elastic waves	341
20.7	Architectural application	342
	References	344
21	Topology Optimization	345
21.1	Matrix sensitivities	345
21.2	Deformation constraint	346
21.3	Natural frequency constraint	348
21.4	The topology optimization process	349
21.5	Aircraft application	351
	References	353

22 Fluid Dynamics	354
22.1 The Navier–Stokes equation	354
22.2 Fluid finite element discretization	355
22.3 Weighted residual form	357
22.4 Element matrix generation	357
22.5 The vorticity equation	359
22.6 The vortex street phenomenon	360
22.7 Marine applications	361
References	363
Appendix: A Numerical Example	364
A.1 Elastic beam element	364
A.2 Structural example	367
A.3 Numerical solution	369
A.4 Static condensation	371
Index	375
