Preface	xi
1 Crystal Structures	1
1.1 Introduction	1
1.1.1 Crystal Classes and Bravais Lattices	1
1.1.2 Crystal Structure: An Atomic Basis Attached to Each Site of a Bravais Lattice	1
2 Wave Diffraction	3
2.1 Optical Diffraction Grating	3
2.1.1 Production of X-rays	4
2.1.2 X-ray Diffraction from Crystals	4
2.1.3 d -Spacings and Miller Indices	4
2.1.4 Bragg's Law and Miller Indices	5
2.1.5 Diffraction Intensities	6
3 Essentials of Thermodynamics and Statistical Mechanics	11
3.1 Probability	11
3.1.1 First Law of Thermodynamics	11
3.1.2 Example: The Ideal Monatomic Gas	12
3.1.3 Statistical Mechanics Definition of Entropy	12
3.1.4 Example: Entropy of an Ideal Gas at Fixed Temperature from Statistical Mechanics	12
3.1.5 Boltzmann Probability Distribution	13
3.1.6 Energy Degeneracy and Density of States	13
3.1.7 Internal Energy and Heat Capacity at Constant Volume	13
3.1.8 Example: Statistical Mechanics of the Classical Ideal Gas versus Temperature	14
3.1.9 Helmholtz Free Energy	16
3.1.10 Gibbs Probability Distribution	17
4 Crystal Lattice Properties	18
4.1 The Schrödinger Wave Equation	18
4.1.1 Quantum-Mechanical Free Particle	19
4.1.2 Quantum-Mechanical One-Dimensional Simple Harmonic Oscillator	19
4.1.3 Thermodynamics of the Quantum-Mechanical Simple Harmonic Oscillator	20
4.1.4 Einstein Lattice Heat Capacity Model and Comparison with the Heat Capacity of Diamond	21
4.1.5 Fixed Boundary Conditions on the Wave Function	22
4.1.6 Periodic Boundary Conditions	23
4.1.7 The Beaded String: Acoustic and Optic Modes of Vibration	23
4.1.8 Debye Model for the Lattice Heat Capacity	24
4.1.9 Debye Model for the Average Lattice Vibrational Energy and the Lattice Heat Capacity	26
5 Noninteracting Local-Moment Magnetism	32
5.1 Magnetic Dipole Moment	32
5.1.1 Spherical Coordinates and Solid Angle	33
5.1.2 Magnetization and Magnetic Susceptibility	33
5.1.3 Macroscopic Internal Magnetic Fields	35

5.1.4	Classical Local-Moment Systems	35
5.1.5	Quantum-Mechanical Local-Moment Systems	40
6	Quantum Magnetic Moments Interacting by Heisenberg Exchange: Molecular Field Theory	46
6.1	Introduction	46
6.1.1	Hamiltonian and Exchange Field	47
6.1.2	Magnetic Ordering Temperature, Ordered Moment, Laws of Corresponding States, and Critical Behavior	48
6.1.3	Magnetic Energy, Heat Capacity, Entropy	50
6.1.4	Curie-Weiss Law in the Paramagnetic State	53
6.1.5	Magnetization versus Field in the Paramagnetic Regime	55
6.1.6	Magnetic Properties of a Collinear Antiferromagnet below its Ordering Temperature T_N . .	55
6.1.7	Noncollinear Antiferromagnets	59
6.1.8	Fisher Relation between Magnetic Heat Capacity and Magnetic Susceptibility near the Ordering Temperature of an Antiferromagnet	61
6.1.9	Magnetization of a Ferromagnet in Finite Field on Cooling Below Its Zero-Field Curie Temperature: Absence of a Ferromagnetic Phase Transition	63
7	Magnetic Resonance	65
7.1	Introduction	65
7.1.1	Driven Damped Simple Harmonic Oscillator	65
7.1.2	Undamped Magnetization Precession in a Static Magnetic Field	66
7.1.3	Free-Induction Decay: Damping	68
7.1.4	Magnetic Resonance without Damping	70
7.1.5	Damped Magnetic Resonance	75
8	Free-Electron Fermi Gas	77
8.1	Introduction	77
8.1.1	Quantum-Mechanical Particle in a Box	77
8.1.2	Pauli Exclusion Principle and Fermi Energy	78
8.1.3	Energy Bands and Fermi Surfaces	79
8.1.4	Free-Electron Fermi Gas at Finite Temperatures: Fermi-Dirac Distribution Function	80
8.1.5	Dimensionless Variables	81
8.1.6	Temperature Dependence of the Chemical Potential	81
8.1.7	Fermi Function at High Temperatures	82
8.1.8	Fermi Function at Low Temperatures	83
8.1.9	Dirac δ Function	83
8.1.10	Integrals Involving the Fermi Function at Low Temperatures	84
8.1.11	Low-Temperature Behavior of the Chemical Potential	84
8.1.12	Magnetic Spin Susceptibility at Zero Temperature	85
8.1.13	Magnetic Spin Susceptibility at Finite Temperatures	87
8.1.14	Magnetic Spin Susceptibility versus Temperature Specific to the Dimensionality of the Electron Gas	88
8.1.15	Heat Capacity of the Free-Electron Gas	90
8.1.16	Wilson Ratio	92
8.1.17	Heat Capacity and Magnetic Susceptibility of a Real Metal	93
8.1.18	Pressure Exerted by a Three-Dimensional Free-Electron Fermi Gas	95
9	Band Structure of Itinerant Electrons in Metallic Solids	97
9.1	Introduction	97
9.1.1	Bloch's Theorem	97
9.1.2	Band Structures of Electrons in One Dimension with a Potential Energy Periodic with the Lattice	97
9.1.3	Kronig-Penney (KP) Model with an Attractive Periodic Square-Well Potential in One Dimension	98

9.1.4	Bound States	102
9.1.5	Kronig-Penney Model with an Attractive Dirac-Comb Potential	106
9.1.6	Extended (Band) States	107
9.1.7	Bound States	116
9.1.8	Overview: Metals, Semimetals, Semiconductors, and Holes versus Electrons	121
10	Electrical Resistivity and Hall Effect	123
10.1	Electrical Conductivity, Conductance, Resistivity, and Resistance	123
10.1.1	Semiclassical Model for the Electrical Resistivity of Metals Arising from Electron-Phonon Scattering	125
10.1.2	Quantum-Mechanical Bloch-Grüneisen Theory of Electrical Resistivity from Electron-Phonon Scattering in Metals	128
10.1.3	Example: Copper Metal	130
10.1.4	Hall Effect	131
10.2	Itinerant Ferromagnetism	133
10.2.1	Introduction	133
10.2.2	Stoner-Hubbard Mean-Field Theory at Zero Temperature	133
10.2.3	Spin-Fluctuation Theory of Itinerant Ferromagnetism, Illustrated by Application to $\text{Sr}(\text{Co}_{1-x}\text{Ni}_x)_2\text{As}_2$ Single Crystals	134
11	Superconductivity	144
11.1	Introduction	144
11.1.1	Type-I and Type-II Superconductors	145
11.1.2	Eras of Superconducting Materials	145
11.1.3	London Equations for Superconductors	147
11.1.4	Microscopic BCS Theory of Superconductivity	147
Appendix A: Notes on Magnetic Susceptibility Experiments		163
A.1	Introduction: Units and Other Things	163
A.1.1	Influence of Ferromagnetic and Paramagnetic Impurities on Magnetic Susceptibility Measurements	164
Bibliography		167
Index		171
