|                                                          |             |
|----------------------------------------------------------|-------------|
| <b>Preface.....</b>                                      | <b>xiii</b> |
| <b>1. How to Deploy Your App.....</b>                    | <b>1</b>    |
| Example: Deploy the Sample App Locally                   | 2           |
| Deploying an App on a Server                             | 3           |
| On-Prem and Cloud Hosting                                | 4           |
| Example: Deploy an App via PaaS (Render)                 | 5           |
| Example: Deploy an App via IaaS (AWS)                    | 7           |
| Comparing Deployment Options                             | 17          |
| On Prem Versus the Cloud                                 | 17          |
| IaaS Versus PaaS                                         | 21          |
| The Evolution of DevOps                                  | 23          |
| Adopting DevOps Practices                                | 33          |
| Conclusion                                               | 35          |
| <b>2. How to Manage Your Infrastructure as Code.....</b> | <b>37</b>   |
| The Benefits of IaC                                      | 39          |
| Ad Hoc Scripts                                           | 40          |
| Example: Deploy an EC2 Instance by Using a Bash Script   | 40          |
| How Ad Hoc Scripts Stack Up                              | 43          |
| Configuration Management Tools                           | 45          |
| Example: Deploy an EC2 Instance by Using Ansible         | 46          |
| Example: Configure a Server by Using Ansible             | 48          |
| How Configuration Management Tools Stack Up              | 53          |
| Server Templating Tools                                  | 55          |
| Example: Create a VM Image by Using Packer               | 57          |

|                                                                          |           |
|--------------------------------------------------------------------------|-----------|
| How Server Templating Tools Stack Up                                     | 60        |
| Provisioning Tools                                                       | 61        |
| Example: Deploy an EC2 Instance by Using OpenTofu                        | 62        |
| Example: Update and Destroy Infrastructure by Using OpenTofu             | 67        |
| Example: Deploy an EC2 Instance by Using an OpenTofu Module              | 69        |
| Example: Deploy an EC2 Instance by Using an OpenTofu Registry Module     | 72        |
| How Provisioning Tools Stack Up                                          | 74        |
| Using Multiple IaC Tools Together                                        | 75        |
| Provisioning Plus Configuration Management                               | 76        |
| Provisioning Plus Server Templating                                      | 76        |
| Provisioning Plus Server Templating Plus Orchestration                   | 77        |
| Adopting IaC                                                             | 77        |
| Conclusion                                                               | 79        |
| <br><b>3. How to Manage Your Apps by Using Orchestration Tools. ....</b> | <b>81</b> |
| An Introduction to Orchestration                                         | 82        |
| Server Orchestration                                                     | 84        |
| Example: Deploy an App Securely and Reliably by Using Ansible            | 84        |
| Example: Deploy a Load Balancer by Using Ansible and nginx               | 89        |
| Example: Roll Out Updates with Ansible                                   | 92        |
| VM Orchestration                                                         | 93        |
| Example: Build a VM Image by Using Packer                                | 94        |
| Example: Deploy a VM Image in an Auto Scaling Group<br>by Using OpenTofu | 96        |
| Example: Deploy an Application Load Balancer by Using OpenTofu           | 98        |
| Example: Roll Out Updates with OpenTofu and Auto Scaling Groups          | 101       |
| Container Orchestration                                                  | 105       |
| Example: A Crash Course on Docker                                        | 106       |
| Example: Create a Docker Image for a Node.js App                         | 109       |
| Example: Deploy a Dockerized App with Kubernetes                         | 112       |
| Example: Deploy a Load Balancer with Kubernetes                          | 117       |
| Example: Roll Out Updates with Kubernetes                                | 119       |
| Example: Deploy a Kubernetes Cluster in AWS by Using EKS                 | 121       |
| Example: Push a Docker Image to ECR                                      | 123       |
| Example: Deploy a Dockerized App into an EKS Cluster                     | 126       |
| Serverless Orchestration                                                 | 127       |
| Example: Deploy a Serverless Function with AWS Lambda                    | 130       |
| Example: Create a Lambda Function URL                                    | 133       |
| Example: Roll Out Updates with AWS Lambda                                | 134       |
| Comparing Orchestration Options                                          | 135       |
| Conclusion                                                               | 138       |

|                                                                             |            |
|-----------------------------------------------------------------------------|------------|
| <b>4. How to Version, Build, and Test Your Code.....</b>                    | <b>139</b> |
| Version Control                                                             | 140        |
| Example: Turn Your Code into a Git Repo                                     | 140        |
| Example: Store Your Code in GitHub                                          | 142        |
| Version-Control Recommendations                                             | 142        |
| Build System                                                                | 147        |
| Example: Configure Your Build by Using npm                                  | 148        |
| Dependency Management                                                       | 151        |
| Example: Add Dependencies in npm                                            | 153        |
| Automated Testing                                                           | 155        |
| Example: Add Automated Tests for the Node.js App                            | 158        |
| Example: Add Automated Tests for the OpenTofu Code                          | 166        |
| Testing Recommendations                                                     | 168        |
| Conclusion                                                                  | 174        |
| <b>5. How to Set Up Continuous Integration and Continuous Delivery.....</b> | <b>175</b> |
| Continuous Integration                                                      | 176        |
| Dealing with Merge Conflicts                                                | 178        |
| Preventing Breakages with Self-Testing Builds                               | 179        |
| Making Large Changes                                                        | 181        |
| Example: Run Automated Tests for Apps in GitHub Actions                     | 184        |
| Machine User Credentials and Automatically Provisioned Credentials          | 190        |
| Example: Configure OIDC with AWS and GitHub Actions                         | 192        |
| Example: Run Automated Tests for Infrastructure in GitHub Actions           | 195        |
| Continuous Delivery                                                         | 199        |
| Deployment Strategies                                                       | 200        |
| Deployment Pipelines                                                        | 208        |
| Deployment Pipeline Recommendations                                         | 222        |
| Conclusion                                                                  | 225        |
| <b>6. How to Work with Multiple Teams and Environments.....</b>             | <b>227</b> |
| Breaking Up Your Deployments                                                | 228        |
| Why Deploy Across Multiple Environments                                     | 228        |
| How to Set Up Multiple Environments                                         | 231        |
| Challenges with Multiple Environments                                       | 233        |
| Example: Set Up Multiple AWS Accounts                                       | 236        |
| Breaking Up Your Codebase                                                   | 247        |
| Why Break Up Your Codebase                                                  | 247        |
| How to Break Up Your Codebase                                               | 250        |
| Challenges with Breaking Up Your Codebase                                   | 254        |

|                                                                  |            |
|------------------------------------------------------------------|------------|
| Example: Deploy Microservices in Kubernetes                      | 264        |
| Conclusion                                                       | 271        |
| <b>7. How to Set Up Networking.....</b>                          | <b>273</b> |
| Public Networking                                                | 274        |
| Public IP Addresses                                              | 274        |
| Domain Name System                                               | 275        |
| Example: Register and Configure a Domain Name in Amazon Route 53 | 277        |
| Private Networking                                               | 283        |
| Physical Private Networks                                        | 285        |
| Virtual Private Networks                                         | 290        |
| Accessing Private Networks                                       | 298        |
| Castle-and-Moat Model                                            | 298        |
| Zero Trust Architecture                                          | 299        |
| SSH                                                              | 303        |
| RDP                                                              | 309        |
| VPN                                                              | 310        |
| Service Communication in Private Networks                        | 313        |
| Service Discovery                                                | 313        |
| Service Communication Protocol                                   | 317        |
| Service Mesh                                                     | 319        |
| Example: Istio Service Mesh with Kubernetes Microservices        | 321        |
| Conclusion                                                       | 330        |
| <b>8. How to Secure Communication and Storage.....</b>           | <b>333</b> |
| Cryptography Primer                                              | 334        |
| Encryption                                                       | 335        |
| Hashing                                                          | 343        |
| Secure Storage                                                   | 348        |
| Secrets Management                                               | 348        |
| Encryption at Rest                                               | 356        |
| Secure Communication                                             | 359        |
| Transport Layer Security                                         | 360        |
| Example: HTTPS with Let's Encrypt and AWS Secrets Manager        | 365        |
| End-to-End Encryption                                            | 375        |
| Conclusion                                                       | 379        |
| <b>9. How to Store Data.....</b>                                 | <b>381</b> |
| Local Storage: Hard Drives                                       | 382        |
| Primary Data Store: Relational Databases                         | 384        |
| Reading and Writing Data                                         | 386        |

|                                                    |            |
|----------------------------------------------------|------------|
| ACID Transactions                                  | 388        |
| Schemas and Constraints                            | 389        |
| Example: PostgreSQL, Lambda, and Schema Migrations | 392        |
| Caching: Key-Value Stores and CDNs                 | 401        |
| Key-Value Stores                                   | 402        |
| CDNs                                               | 404        |
| File Storage: File Servers and Object Stores       | 406        |
| File Servers                                       | 406        |
| Object Stores                                      | 408        |
| Example: Serving Files with S3 and CloudFront      | 409        |
| Semistructured Data and Search: Document Stores    | 415        |
| Reading and Writing Data                           | 416        |
| ACID Transactions                                  | 418        |
| Schemas and Constraints                            | 418        |
| Analytics: Columnar Databases                      | 420        |
| Columnar Database Basics                           | 421        |
| Analytics Use Cases                                | 423        |
| Asynchronous Processing: Queues and Streams        | 424        |
| Message Queues                                     | 425        |
| Event Streams                                      | 427        |
| Scalability and Availability                       | 432        |
| Relational Databases                               | 432        |
| NoSQL and NewSQL Databases                         | 434        |
| Distributed Systems                                | 435        |
| Backup and Recovery                                | 437        |
| Backup Strategies                                  | 438        |
| Backup Recommendations                             | 441        |
| Example: Backups and Read Replicas with PostgreSQL | 442        |
| Conclusion                                         | 445        |
| <b>10. How to Monitor Your Systems.....</b>        | <b>449</b> |
| Logs                                               | 450        |
| Log Levels                                         | 451        |
| Log Formatting                                     | 453        |
| Structured Logging                                 | 455        |
| Log Files and Rotation                             | 457        |
| Log Aggregation                                    | 458        |
| Metrics                                            | 461        |
| Types of Metrics                                   | 462        |
| Using Metrics                                      | 466        |
| Example: Metrics in CloudWatch                     | 469        |

|                                                       |            |
|-------------------------------------------------------|------------|
| Events                                                | 473        |
| Observability                                         | 473        |
| Tracing                                               | 476        |
| Testing in Production                                 | 478        |
| Alerts                                                | 481        |
| Triggers                                              | 481        |
| Notifications                                         | 482        |
| On Call                                               | 483        |
| Incident Response                                     | 485        |
| Example: Alerts in CloudWatch                         | 487        |
| Conclusion                                            | 490        |
| <b>11. The Future of DevOps and Software Delivery</b> | <b>493</b> |
| Infrastructureless                                    | 493        |
| Generative AI                                         | 495        |
| Secure by Default                                     | 498        |
| Platform Engineering                                  | 501        |
| The Future of Infrastructure Code                     | 503        |
| Conclusion                                            | 504        |
| <b>Index</b>                                          | <b>505</b> |
