1	Introduction	1
2	Quantisation of the Electromagnetic Field and Spontaneous Photon Emission	4
2.1	Introduction	4
2.2	The Principle of Canonical Quantisation	4
2.3	The Quantum Theory of Radiation	6
2.3.1	Maxwell's theory as a classical field theory	6
2.3.2	Quantum theory of the free electromagnetic field—photons	9
2.4	Interaction of Atoms and Radiation	13
2.4.1	The Hamiltonian	13
2.4.2	Elements of perturbation theory	14
2.4.3	The transition probability	15
2.4.4	Application to the problem of spontaneous emission	18
2.5	Problems	21
3	Elements of Classical Field Theory	24
3.1	Introduction	24
3.2	Lagrangian and Hamiltonian Mechanics	24
3.3	Classical Field Theory	27
3.4	Problems	33
4	Scattering in Classical and Quantum Physics	35
4.1	Introduction	35
4.2	The Scattering Cross Section	35
4.3	Collisions in Non-Relativistic Quantum Mechanics	40
4.3.1	The range and the strength of the interactions	40
4.3.2	Potential scattering	42
4.4	Problems	50
5	Elements of Group Theory	51
5.1	Introduction	51
5.2	Groups and Representations	51
5.3	Lie Groups	57
5.4	Lie Algebras	59
5.5	Examples of Lie Groups and their Algebras	64
5.5.1	The group $U(1)$	64
5.5.2	The group $SU(2)$	64
5.5.3	The group $O(3)$	75
5.5.4	The group $SU(3)$	79

5.6	The Lorentz and Poincaré Groups	91
5.6.1	The Lorentz group	91
5.6.2	The Poincaré group	100
5.7	The Space of Physical States	102
5.7.1	Introduction	102
5.7.2	Particle states	102
5.7.3	The Fock space	105
5.7.4	Action of internal symmetry transformations on $\mathcal{F}$	106
5.7.5	Action of Poincaré transformations on $\mathcal{F}$	107
5.8	Problems	109
6	Particle Physics Phenomenology	111
6.1	Introduction	111
6.2	Rutherford and the Atomic Nucleus	111
6.3	β -Decay and the Neutrino	113
6.4	1932: The First Table of Elementary Particles	117
6.4.1	Everything is simple	117
6.4.2	Conservation laws – baryon and lepton number	120
6.4.3	The four fundamental interactions	121
6.5	Heisenberg and the Symmetries of Nuclear Forces	122
6.6	Fermi and the Weak Interactions	127
6.7	The Muon and the Pion	129
6.8	From Cosmic Rays to Particle Accelerators	131
6.8.1	Introduction	131
6.8.2	Electrostatic accelerators	132
6.8.3	Linear accelerators	133
6.8.4	Cyclotrons	134
6.8.5	Colliders	138
6.9	The Detectors	142
6.9.1	Introduction	142
6.9.2	Bubble chambers	142
6.9.3	Counters	144
6.10	New Elementary Particles and New Quantum Numbers	148
6.10.1	Unstable particles	148
6.10.2	Resonances	149
6.10.3	$SU(2)$ as a classification group for hadrons	151
6.10.4	Strange particles	152
6.11	The Eightfold Way and the Quarks	156
6.11.1	From $SU(2)$ to $SU(3)$	156
6.11.2	The arrival of the quarks	157
6.11.3	The breaking of $SU(3)$	159
6.11.4	Colour	162
6.12	The Present Table of Elementary Particles	163
6.13	Problems	165

7 Relativistic Wave Equations	167
7.1 Introduction	167
7.2 The Klein–Gordon Equation	167
7.2.1 The Green’s functions	168
7.2.2 Generalisations	172
7.3 The Dirac Equation	173
7.3.1 Introduction	173
7.3.2 Weyl and Majorana equations	174
7.3.3 The Dirac equation	175
7.3.4 The γ matrices	176
7.3.5 The conjugate equation	177
7.3.6 The standard representation	178
7.3.7 Lagrangian, Hamiltonian and Green functions	179
7.3.8 The plane wave solutions	180
7.4 Relativistic Equations for Vector Fields	183
7.4.1 The Maxwell field	184
7.4.2 Massive spin-1 field	186
7.4.3 Plane wave solutions	187
7.5 Problems	188
8 Towards a Relativistic Quantum Mechanics	191
8.1 Introduction	191
8.2 The Klein–Gordon Equation	191
8.3 The Dirac Equation	192
8.3.1 Introduction	192
8.3.2 The conserved current	193
8.3.3 The coupling with the electromagnetic field	193
8.3.4 The non-relativistic limit of the Dirac equation	194
8.3.5 Negative energy solutions	195
8.3.6 Charge conjugation	196
8.3.7 <i>CPT</i> symmetry	198
8.3.8 Chirality	199
8.3.9 Hydrogenoid systems	199
8.4 Problems	204
9 From Classical to Quantum Mechanics	207
9.1 Introduction	207
9.2 Quantum Mechanics and Path Integrals	208
9.2.1 The Feynman postulate	211
9.2.2 Recovering quantum mechanics	211
9.3 Problems	219
10 From Classical to Quantum Fields. Free Fields	220
10.1 Introduction	220

10.2	The Klein–Gordon Field	221
10.2.1	The canonical quantisation	221
10.2.2	The path integral quantisation	224
10.3	The Dirac Field	226
10.3.1	The canonical quantisation	226
10.3.2	The path integral quantisation	228
10.4	The Maxwell Field	230
10.4.1	The canonical quantisation	230
10.4.2	The path integral quantisation	233
10.5	Massive Spin-1 Fields	235
10.6	Problems	235
11	Interacting Fields	237
11.1	Introduction – The Axioms of Quantum Field Theory	237
11.2	General Results: Invariance under <i>CPT</i> and the Spin-Statistics Theorem	239
11.2.1	The <i>CPT</i> theorem	239
11.2.2	The spin-statistics theorem	240
11.3	Examples of Interacting Theories	241
11.4	Interacting Quantum Field Theories	243
11.5	The Perturbation Expansion	244
11.5.1	The configuration space Feynman rules	244
11.5.2	The momentum space Feynman rules	246
11.5.3	Feynman rules for quantum electrodynamics	249
11.5.4	Feynman rules for other theories	249
11.6	Problems	251
12	Scattering in Quantum Field Theory	253
12.1	The Asymptotic Theory	253
12.1.1	The asymptotic states	253
12.1.2	The asymptotic fields	255
12.2	The Reduction Formula	256
12.3	The Feynman Rules for the Scattering Amplitude	259
12.3.1	One scalar field	259
12.3.2	Quantum electrodynamics	259
12.4	The Transition Probability	261
12.4.1	The cross section	262
12.4.2	The decay rate	263
12.5	Examples	263
12.5.1	The electron Compton scattering	263
12.5.2	The electron–positron annihilation into a muon pair	266
12.5.3	The charged pion decay rate	269
12.6	Problems	271
13	Gauge Interactions	273
13.1	The Abelian Case	273

13.2	Non-Abelian Gauge Invariance and Yang–Mills Theories	276
13.2.1	Quantisation of Yang–Mills theories	279
13.2.2	Feynman rules for Yang–Mills theories	280
13.3	Gauge Theories on a Space-Time Lattice	281
13.4	Brief Historical Notes	283
13.5	Problems	286
14	Spontaneously Broken Symmetries	287
14.1	Introduction	287
14.2	Global Symmetries	288
14.2.1	Simple examples	288
14.2.2	A field theory model	290
14.2.3	Goldstone theorem	293
14.3	Gauge Symmetries	295
14.3.1	The Abelian model	295
14.3.2	The non-Abelian case	299
14.4	Problems	300
15	The Principles of Renormalisation	304
15.1	The Need for Renormalisation	304
15.2	The Theory of Renormalisation	305
15.2.1	The power counting	306
15.2.2	Regularisation	308
15.2.3	Renormalisation	311
15.3	The Renormalisation Group	320
15.3.1	Renormalisation group in dimensional regularisation	325
15.4	Problems	326
16	The Electromagnetic Interactions	329
16.1	Introduction	329
16.2	Quantum Electrodynamics	330
16.3	Problems	334
17	Infrared Effects	335
17.1	Introduction	335
17.2	Examples of Infrared Divergent Terms in Perturbation Theory	335
17.3	Infrared Phenomena in QED	337
17.3.1	Tree-level ($\mathcal{O}(\alpha^2)$) electron Coulomb scattering	337
17.3.2	One-loop corrections to the electron Coulomb scattering	339
17.3.3	Infrared divergence of the photon emission amplitude	341
17.3.4	The $\mathcal{O}(\alpha^3)$ measured cross section is infrared finite	342
17.4	The Summation to All Orders	342
17.5	The QED Asymptotic Theory Revisited	343
17.5.1	The Faddeev-Kulish dressed electron states	343
17.5.2	Coulomb scattering of a dressed electron	346
17.6	Problems	348

18 The Weak Interactions	349
18.1 Introduction	349
18.2 The Fermi Theory	350
18.3 Parity Violation	351
18.4 Vector vs Scalar: The Neutrino Helicity	356
18.5 The $V - A$ Theory	357
18.6 Leptonic Interactions	359
18.6.1 Muon decay	360
18.6.2 Other purely leptonic weak processes	362
18.7 Semi-Leptonic Interactions	363
18.7.1 Strangeness conserving semi-leptonic weak interactions	363
18.7.2 Strangeness violating semi-leptonic weak interactions	376
18.8 Purely Hadronic Weak Interactions	378
18.9 The Intermediate Vector Boson (IVB) Hypothesis	378
18.10 Charged and Neutral Currents	379
18.11 CP Violation	380
18.12 Problems	385
19 A Gauge Theory for the Weak and Electromagnetic Interactions	388
19.1 Introduction	388
19.2 The Rules of Model Building	389
19.3 The Lepton World	389
19.4 Extension to Hadrons	393
19.5 Problems	401
20 Neutrino Physics	405
20.1 A Blessing and a Curse	405
20.1.1 The first neutrino beams	406
20.1.2 Gargamelle and the neutral currents	409
20.1.3 Very high energy neutrino beams	412
20.2 Neutrino Masses and Oscillations	413
20.2.1 Introduction	413
20.2.2 Experimental evidence for neutrino oscillations	416
20.2.3 The neutrino mass matrix	418
20.2.4 Neutrinoless double β decay	420
20.3 Problems	420
21 The Strong Interactions	422
21.1 Strong Interactions are Complicated	422
21.2 Strong Interactions are Simple	423
21.3 Asymptotic Freedom	426
21.4 Quantum Chromodynamics	426
21.4.1 Quantum chromodynamics in perturbation theory	430
21.4.2 Quantum chromodynamics and hadronic physics	437
21.5 Problems	440

22 The Standard Model and Experiment	442
22.1 A Unified Picture	442
22.2 Classic Experiments	442
22.2.1 Experimental discovery of charmed particles	443
22.2.2 Stochastic cooling and the discovery of $W^\pm$ and Z	446
22.2.3 The discovery of the heavy quarks and of the Brout–Englert–Higgs boson	449
22.3 Hadron Spectroscopy	455
22.4 The Cabibbo–Kobayashi–Maskawa Matrix and CP Violation	462
22.4.1 The matrix elements	462
22.4.2 Unitarity	463
22.4.3 CP violation	465
22.5 The Neutrino Matrix and CP Violation	469
22.6 Questions of Flavour	470
22.6.1 A brief history of flavour	470
22.6.2 Rare flavour decays	471
22.7 An Overall Fit	473
22.8 Problems	477
23 Beyond the Standard Model	479
23.1 Many Questions	479
23.2 Beyond, but How?	481
23.2.1 Grand unified theories (GUTs)	481
23.2.2 The trial of scalars	482
23.2.3 Supersymmetry, or the defence of scalars	483
23.3 Closing Remarks	487
Appendix A A Collection of Useful Formulae	488
A.1 Units and Notations	488
A.2 Free Fields	489
A.3 Feynman Rules for Scattering Amplitudes	490
Index	493
