

CONTENTS

CHAPTER 1.

1	1	TRANSDUCTION OF ENERGY IN BIOLOGICAL ELECTRON TRANSPORT SYSTEMS
3	1.1	Electron transfer and transduction of energy in mitochondrial membranes
11	1.2	General scheme of the primary events of photosynthesis
17	1.3	Energy migration and arrangement of the photosynthetic pigment apparatus
17	1.3.1	Energy migration
17	1.3.2	Excitation energy migration pathways
18	1.3.3	Redistribution of excitation energy
21	1.4	Reaction centres of photosynthetizing purple bacteria
21	1.4.1	Components of the reaction centre
23	1.4.2	Kinetics of the electron transfer reactions
26	1.5	Photosystem 1 reaction centres of green plants
28	1.6	Photosystem 2 reaction centres of green plants
28	1.6.1	Function of photosystem 2 reaction centres
31	1.6.2	Oxygen evolution
33	1.7	Conclusion

CHAPTER 2.

35	2	MATHEMATICAL DESCRIPTION OF PHOTOSYNTHETIC ELECTRON TRANSPORT BY MEANS OF DIFFERENTIAL EQUATIONS
37	2.1	Mathematical models of electron transfer in biological systems - Historical review
40	2.2	Description of electron transfer by the mass action law
42	2.3	Mathematical models of the Z-configuration of the photosynthetic systems of higher plants
48	2.4	Probabilistic description of electron transfers in multi-enzyme complexes
48	2.4.1	State probabilities
51	2.4.2	Methods of analysis of electron transfer in a complex

52	2.4.3	Comparison of the two foregoing descriptions of electron transport in biological systems
54	2.5	Electron transfer model for the photosynthetic reaction centre
59	2.6	Oxidation-reduction conversions of reaction centre bacteriochlorophyll in purple bacteria
59	2.6.1	Bacterial reaction centre
61	2.6.2	The dark recovery process
66	2.7	Electron-exchange interactions in chromatophores of photosynthetic bacteria
66	2.7.1	Chromatophores of photosynthetic bacteria
68	2.7.2	Donor side of the chain
72	2.7.3	The acceptor side of the chain
75	2.8	Identification of parameters of electron-transfer models
81	2.9	Physical concepts of electron transfer
81	2.9.1	Mechanism of electron transfer
84	2.9.2	Electronic-conformational interactions
87	2.10	Organization of the acceptor side of the reaction centre in purple bacteria
87	2.10.1	General physical mechanisms
94	2.10.2	Physical mechanisms of the regulation of electron transfer rates
95	2.10.3	Electron tunnelling mechanism
96	2.10.4	Effect of Coulomb interactions
97	2.10.5	Involvement of configurational rearrangements in the regulation processes
99	2.10.6	Motion along the conformational coordinate
102	2.11	Analysis of the kinetic conformational characteristic of the pigment-protein complexes of photosystem 1 of higher plants
110	2.12	Physical mechanisms of electron transfer regulation at the donor side of photosystem 1 - functional role of plastocyanine
110	2.12.1	Physical processes
112	2.12.2	Mathematical model
116	2.12.3	Comparison of model and experimental data

CHAPTER 3.

121	3	DISCRETE COMPUTER SIMULATION OF THE ELECTRON TRANSPORT PROCESSES
123	3.1	Introduction
125	3.2	Concept of the discrete simulation models
127	3.3	Formal discrete description of ET structures
127	3.3.1	Topology of the structure
129	3.3.2	Dynamic state of the structure
130	3.3.3	Rules of electron jumps and stochastic properties of ET processes
132	3.3.4	History of ET processes
136	3.3.5	The form of simulation results
137	3.3.6	Internal organization of modelled ET structure
140	3.4	Synchronous models
140	3.4.1	Markovian transport structures
144	3.4.2	Organization and construction of synchronous models
148	3.5	Asynchronous Markovian models
148	3.5.1	General principles
149	3.5.2	Organization and construction of asynchronous Markovian models
152	3.6	Universal asynchronous models based on planning of events
152	3.6.1	Introduction
152	3.6.2	Formal concept of universal models
154	3.6.3	Electron jump planning
159	3.6.4	Organization and implementation of universal models

CHAPTER 4.

163	4	CONCLUSION
165		References and bibliography
175		Index
