PREFACE TO THE SECOND ENGLISH EDITION.	V
PREFACE TO THE FIRST ENGLISH EDITION	VI
PREFACE TO THE FIRST GERMAN EDITION	VII
CONTENTS	XI

I. MATRICES

1. Vectors	1
2. Linear mappings. Matrices	3
3. Algebras	8
4. Quadratic and hermitian forms; orthogonal and unitary matrices .	9
5. Eigenvalues and transformation to diagonal form	12
6. Two other ways of combining matrices; the KRONECKER product .	16
7. Equivalence and reducibility of matrix systems. SCHUR's lemma .	19
8. Commutativity of matrix systems	22
9. Examples of irreducible systems. An application of SCHUR's lemma	24

II. GROUPS

1. Elementary group theory	26
2. The symmetric and alternating groups	28
3. Continuous groups	32
4. The matrix exponential function	34
5. The infinitesimal ring of a linear group	36
6. Integration in LIE groups	42

III. GENERAL REPRESENTATION THEORY

1. Concept of a representation. Complete reducibility of the representations of finite groups. Uniqueness of the decomposition . .	46
2. The group ring and the regular representation	53
3. Structure of the group ring. Preliminary theorems	58
4. The structure of the group ring and the system of classes of irreducible representations	63
5. Representation theory of semi-simple algebras	72
6. Normal representations	74
7. Characters.	75
8. a. Characters and group ring	81
b. Representations and characters of a direct product	83
c. Algebraic properties of the characters	85

9.	The infinitesimal transformations of the representations of continuous groups	88
10.	The adjoint representation	89
11.	The characters of continuous groups	91
12.	Projective representations	94
13.	Group and subgroup	96
	a. Induced representations	96
	b. The case of a normal subgroup	99

IV. REPRESENTATIONS OF THE SYMMETRIC GROUP

1.	The tableaux	109
2.	Lemmata for the tableaux	112
3.	The irreducible representations	116
4.	The standard tableaux. Complete reduction of the group ring	118
5.	YOUNG's seminormal representation	121
6.	YOUNG's orthogonal representation	133
7.	Proofs of theorems 4.2 and 4.3	135

V. REPRESENTATIONS OF THE FULL LINEAR, UNIMODULAR AND UNITARY GROUPS

1.	Preliminary remarks	140
2.	The KRONECKER square and symmetric and antisymmetric second rank tensors	141
3.	Tensors of rank ν and representations of the group G_n of polynomial degree ν	144
4.	The symmetry classes in tensor space	153
5.	The tableaux and the integral representations of the full linear group	160
6.	The branching theorem	174
7.	Integral representations of the real linear, unimodular and unitary groups	178
8.	Rational and semirational representations	180
9.	The indecomposable representations of the additive group of real numbers	186
10.	The continuous representations of the full and real linear groups and of the unimodular and unitary groups.	190

VI. CHARACTERS OF THE LINEAR AND PERMUTATION GROUPS. THE ALTERNATING GROUP

1.	The characteristics and the degrees of the integral representations of the full linear group	198
2.	Connection between the characters of the symmetric group and the characteristics of the full linear group	202
3.	Calculation of the characters of the symmetric group. Survey of the representations of the alternating group	206
4.	Another formula for calculating the characters of S_ν	211

5.	Analysis of KRONECKER products in the symmetric and full linear groups	215
6.	The characters of the alternating group	220

VII. CHARACTERS AND SINGLE-VALUED REPRESENTATIONS OF THE ROTATION GROUP

1.	Connectivity properties of the rotation group	229
2.	The toroid T_p	236
3.	The STIEFEL diagram	237
4.	The group Ψ	240
5.	The fundamental domains of the group Ψ	243
6.	The eigenvalues of the representations	246
7.	The eigenvalues of the adjoint representation	249
8.	The integral over a class function.	251
9.	Invariant and alternating polynomials and elementary sums	255
10.	The system of simple characters	260
11.	The representation degree	265
12.	The branching theorem	266
13.	Application to the lowest dimension numbers	270
14.	The fundamental representations	272
15.	The full orthogonal group	277

VIII. SPIN REPRESENTATIONS, INFINITESIMAL RING, ORDINARY ROTATION GROUP

1.	The infinitesimal ring of the rotation group	280
2.	CLIFFORD's algebra and its connection with the infinitesimal rotations	282
3.	Representation theory of the CLIFFORD algebra	284
4.	The spin representations of the infinitesimal ring of the rotation group	288
5.	The spin representations of the rotation group	290
	a. The method of BRAUER and WEYL	290
	b. The method of FREUDENTHAL	298
6.	The ordinary rotation group d_3	302
7.	The CLEBSCH-GORDAN formula	304
8.	Structure of the infinitesimal ring and weights of the representations	305
9.	Further KRONECKER products. KEMMER and DE BROGLIE algebras	311

IX. THE LORENTZ GROUP

1.	The four pieces of the LORENTZ group	315
2.	Fundamental representations of the LORENTZ group $L_{n,t}$	321
3.	The ordinary proper LORENTZ group $l_{4,1}$ and its relationship to the unimodular group g_2	324
4.	The representations of the full LORENTZ group $L_{4,1}$	327
