|----------------------------------------------------------------------------------------------------|-------|
| List of Figures .....                                                                              | x     |
| List of Tables .....                                                                               | xvii  |
| Authors .....                                                                                      | xviii |
| <br>                                                                                               |       |
| <b>Chapter 1</b> Getting Started with KNIME and Its Geospatial Analytics Extension .....           | 1     |
| 1.1 KNIME Analytics Platform .....                                                                 | 1     |
| 1.2 KNIME Extension for Spatial Analysis .....                                                     | 5     |
| 1.3 Case Study 1: Mapping and Analyzing Population Density Pattern in Baton Rouge, Louisiana ..... | 10    |
| 1.3.1 Creating Workflow, Reading and Visualizing Data .....                                        | 10    |
| 1.3.2 Extracting the Study Area .....                                                              | 15    |
| 1.3.3 Examining Urban Population Density Pattern Based on Census Tract Data .....                  | 18    |
| 1.3.4 Examining Urban Population Density Pattern Based on Census Block Data .....                  | 24    |
| 1.4 Concluding Remarks .....                                                                       | 28    |
| <br>                                                                                               |       |
| <b>Chapter 2</b> Measuring Distance and Time and Analyzing Distance Decay Behavior .....           | 42    |
| 2.1 Case Study 2A: Estimating Travel Times to Hospitals in Baton Rouge .....                       | 42    |
| 2.1.1 Geocoding Hospitals from Street Addresses or Geographic Coordinates .....                    | 43    |
| 2.1.2 Estimating Euclidean and Manhattan Distances Based on the OD Coordinates .....               | 47    |
| 2.1.3 Estimating and Comparing Distances by Different Sources .....                                | 50    |
| 2.2 Case Study 2B: Analyzing Distance Decay Behavior for Hospitalization in Florida .....          | 57    |
| 2.3 Concluding Remarks .....                                                                       | 62    |
| <br>                                                                                               |       |
| <b>Chapter 3</b> Spatial Smoothing and Spatial Interpolation .....                                 | 63    |
| 3.1 Case Study 3A: Mapping Place Names in Guangxi, China .....                                     | 63    |
| 3.2 Case Study 3B: Area-Based Interpolations of Population in Baton Rouge, Louisiana .....         | 70    |
| 3.2.1 Implementing Areal Weighting Interpolation .....                                             | 70    |
| 3.2.2 Implementing Target-Density Weighting (TDW) Interpolation .....                              | 71    |

|                  |                                                                                                            |            |
|------------------|------------------------------------------------------------------------------------------------------------|------------|
| 3.3              | Case Study 3C: Detecting Spatiotemporal Crime Hotspots in Baton Rouge, Louisiana .....                     | 75         |
| 3.3.1            | Exploring Time Series Heatmap Based on Kepler.gl GeoView .....                                             | 75         |
| 3.3.2            | Implementing Time Series Heatmap Based on Grid Aggregation .....                                           | 77         |
| 3.3.3            | Implementing Spatiotemporal Kernel Density Estimation .....                                                | 81         |
| 3.4              | Concluding Remarks .....                                                                                   | 85         |
| <b>Chapter 4</b> | <b>Delineating Functional Regions and Application in Health Geography .....</b>                            | <b>87</b>  |
| 4.1              | Case Study 4A: Defining Service Areas of Acute Hospitals in Baton Rouge, Louisiana .....                   | 87         |
| 4.1.1            | Defining HSAs by the Proximal Area Method .....                                                            | 88         |
| 4.1.2            | Defining HSAs by the Huff Model .....                                                                      | 91         |
| 4.2              | Case Study 4B: Automated Delineation of Hospital Service Areas in Florida .....                            | 94         |
| 4.2.1            | Part 1: Delineating HSAs by the Refined Dartmouth Method .....                                             | 95         |
| 4.2.2            | Part 2: Delineating HSAs by Spatialized Network Community Detection Methods .....                          | 101        |
| 4.3              | Concluding Remarks .....                                                                                   | 108        |
| <b>Chapter 5</b> | <b>GIS-Based Measures of Spatial Accessibility and Application in Examining Healthcare Disparity .....</b> | <b>109</b> |
| 5.1              | Part 1: Measuring Accessibility of Primary Care Physicians in Baton Rouge .....                            | 109        |
| 5.1.1            | Implementing the 2SFCA Method .....                                                                        | 110        |
| 5.1.2            | Implementing the Gravity-Based 2SFCA Method .....                                                          | 113        |
| 5.2              | Part 2: Implementing the 2SVCA Method .....                                                                | 114        |
| 5.3              | Part 3: Sensitive Analysis for Measuring Accessibility by Workflow Automation .....                        | 118        |
| 5.3.1            | Standard Component for 2SFCA Method .....                                                                  | 118        |
| 5.3.2            | Sensitive Analysis with 2SFCA Component and Workflow Loop .....                                            | 126        |
| 5.4              | Concluding Remarks .....                                                                                   | 129        |
| <b>Chapter 6</b> | <b>Function Fittings by Regressions and Application in Analyzing Urban Density Patterns .....</b>          | <b>130</b> |
| 6.1              | Part 1: Function Fittings for Monocentric Models at the Census Tract Level .....                           | 131        |
| 6.2              | Part 2: Function Fittings for Polycentric Models at the Census Tract Level .....                           | 135        |

|                  |                                                                                                                |            |
|------------------|----------------------------------------------------------------------------------------------------------------|------------|
| 6.3              | Part 3: Function Fittings for Monocentric Models at the Township Level.....                                    | 142        |
| 6.4              | Concluding Remarks .....                                                                                       | 144        |
| <b>Chapter 7</b> | <b>Principal Components, Factor Analysis and Cluster Analysis and Application in Social Area Analysis.....</b> | <b>146</b> |
| 7.1              | Part 1: Principal Components Analysis (PCA).....                                                               | 147        |
| 7.2              | Part 2: Cluster Analysis (CA) .....                                                                            | 151        |
| 7.3              | Part 3: Detecting Urban Structure Models by Regression.....                                                    | 154        |
| 7.4              | Concluding Remarks .....                                                                                       | 155        |
| <b>Chapter 8</b> | <b>Spatial Statistics and Applications .....</b>                                                               | <b>157</b> |
| 8.1              | Case Study 8A: Spatial Distribution and Clusters of Place Names in Yunnan, China.....                          | 157        |
| 8.1.1            | Part 1: Analysis of Multiethnic Place Names by Centographic Measures.....                                      | 159        |
| 8.1.2            | Part 2: Cluster Analysis of Multiethnic Place Names by SaTScanR.....                                           | 161        |
| 8.2              | Case Study 8B: Detecting Colocation between Crime Incidents and Facilities .....                               | 164        |
| 8.2.1            | Part 1: Global Colocation Quotient (GCLQ) .....                                                                | 166        |
| 8.2.2            | Part 2: Local Colocation Quotient (LCLQ).....                                                                  | 168        |
| 8.3              | Case Study 8C: Spatial Cluster and Regression Analyses of Homicide Patterns in Chicago.....                    | 171        |
| 8.3.1            | Part 1: Spatial Cluster Analysis of Homicide Rates .....                                                       | 171        |
| 8.3.2            | Part 2: Regression Analysis of Homicide Patterns .....                                                         | 174        |
| 8.4              | Concluding Remarks .....                                                                                       | 176        |
| <b>Chapter 9</b> | <b>Regionalization Methods and Application in Analysis of Cancer Data.....</b>                                 | <b>180</b> |
| 9.1              | Part 1: One-Level Regionalization .....                                                                        | 180        |
| 9.1.1            | Implementing SKATER, AZP, MaxP, SCHC and REDCAP Methods .....                                                  | 181        |
| 9.1.2            | Implementing MSSC and MPC Modules in MLR ....                                                                  | 181        |
| 9.2              | Part 2: Calibrating Clustering Indicators WTVR and Compactness.....                                            | 184        |
| 9.2.1            | Calculating Within-Total Variance Ratio (WTVR) ....                                                            | 184        |
| 9.2.2            | Calculating Compactness Indices.....                                                                           | 188        |
| 9.3              | Part 3: Mixed-Level Regionalization (MLR) .....                                                                | 189        |
| 9.3.1            | Implementing MLR on Disaggregation Parishes (Type I).....                                                      | 190        |
| 9.3.2            | Implementing MLR on No-Action Parishes (Type II).....                                                          | 192        |

|                   |                                                                                                                                    |            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------|------------|
| 9.3.3             | Implementing MLR on Aggregation Parishes (Type III) .....                                                                          | 193        |
| 9.3.4             | Aggerating All Clusters as MLR .....                                                                                               | 194        |
| 9.4               | Concluding Remarks .....                                                                                                           | 194        |
| <b>Chapter 10</b> | <b>System of Linear Equations and Application of Garin-Lowry Model in Simulating Urban Population and Employment Patterns.....</b> | <b>196</b> |
| 10.1              | Implementing the Garin-Lowry Model in a Hypothetical City .....                                                                    | 196        |
| 10.2              | Part 1: The Basic Scenario of a Monocentric City .....                                                                             | 197        |
| 10.3              | Part 2: Exploring Other Scenarios .....                                                                                            | 202        |
| 10.4              | Concluding Remarks .....                                                                                                           | 203        |
| <b>Chapter 11</b> | <b>Linear and Quadratic Programming and Applications in Examining Wasteful Commuting and Allocating Healthcare Providers .....</b> | <b>204</b> |
| 11.1              | Case Study 11A: Measuring Wasteful Commuting in Columbus, Ohio.....                                                                | 204        |
| 11.2              | Case Study 11B: Location-Allocation Analysis of Hospitals in Rural China .....                                                     | 209        |
| 11.2.1            | Part 1: Data Preparation .....                                                                                                     | 209        |
| 11.2.2            | Part 2: Location Optimization for Site Selection .....                                                                             | 212        |
| 11.2.3            | Part 3: Implementing the MAEP to Derive Capacities for Sited New Hospitals.....                                                    | 216        |
| 11.3              | Concluding Remarks .....                                                                                                           | 219        |
| <b>Chapter 12</b> | <b>Monte Carlo Method and Applications in Urban Population and Traffic Simulations .....</b>                                       | <b>220</b> |
| 12.1              | Case Study 12A: Deriving Urban Population Density Functions in Uniform Area Unit in Chicago by Monte Carlo Simulation.....         | 220        |
| 12.2              | Case Study 12B: Monte Carlo Based Traffic Simulation in Baton Rouge, Louisiana .....                                               | 227        |
| 12.2.1            | Part 1: Estimating Inter-Zonal O-D Trip Volumes .....                                                                              | 229        |
| 12.2.2            | Part 2: Simulating Individual Trip Origins and Destinations .....                                                                  | 231        |
| 12.2.3            | Part 3: Simulating Individual OD Pairs.....                                                                                        | 232        |
| 12.2.4            | Part 4: Trip Assignment and Model Validation .....                                                                                 | 234        |
| 12.3              | Concluding Remarks .....                                                                                                           | 237        |

|                         |                                                                                      |            |
|-------------------------|--------------------------------------------------------------------------------------|------------|
| <b>Chapter 13</b>       | <b>Agent-Based Model and Application in Crime Simulation .....</b>                   | <b>239</b> |
| 13.1                    | Part 1: Simulating Crimes in the Base Scenario in ABM<br>in Baton Rouge .....        | 240        |
| 13.2                    | Part 2: Evaluating ABM Crime Simulation Results .....                                | 243        |
| 13.3                    | Part 3: Testing Various Hypotheses by ABM Crime<br>Simulation.....                   | 247        |
| 13.4                    | Concluding Remarks .....                                                             | 248        |
