reface	vii
about the Authors	xi
1. Model and Modelling, General Remarks	1
1.1 <i>A Priori</i> Information	1
1.1.1 Subjective information	2
1.1.2 Complexity	2
1.1.3 Simulation	3
1.1.4 Model evaluation	3
1.1.5 Scope of a model	4
1.1.6 Philosophical considerations	4
1.1.7 Adequacy requirement	4
1.1.8 Simplicity and optimality	6
1.2 Phenomenological and Semi-Empirical Laws	7
1.3 Numerical Experiments	7
1.3.1 Mixed methods (numerical and analytical) . . .	10
1.3.2 Notes on impossible events	10
1.3.3 Digital machines	11
1.3.4 The role of examples	13
2. Sets of Numbers and Modelling	15
2.1 On the Concept of a Mathematical Model	15
2.1.1 Number systems and sets	19
2.1.2 The problem of infinity	21
2.2 About Big and Small Numbers	23
2.3 Unitless Is Simple But Consequential	25
2.4 Methods Vary – Caution Is Advised	25

2.5	Reasons for Rescaling Measures	26
2.5.1	Essentials of rescaling methods	27
2.5.2	Standardisation (z_1, z_2)	27
2.5.3	Unitisation method	28
2.5.4	Distance to a reference element	29
2.5.5	Quotient conversions	29
2.5.6	Range methods	30
2.5.7	Categorical scale for each indicator	30
3.	Orders, Rankings, ...?	33
3.1	What Does Setting the Order Mean?	33
3.1.1	Objects and their characteristics	35
3.1.2	Ranking and classification	36
3.1.3	Why rankings?	37
3.1.4	Constructing orders on multidimensional objects	38
3.1.5	Threshold methods: Criterion hierarchy method	38
3.1.6	Cluster concept and analysis	39
3.1.7	TOPSIS method	42
3.2	Linear Order	46
3.3	Composite Indicator	47
3.3.1	To weight? How?	49
3.3.2	Normalisation does impair ordering!	49
3.3.3	Linear ranking	54
3.3.4	True? Maybe. Objective? No	55
3.3.5	Partial order	56
3.3.6	Hasse diagram and domination	59
3.3.7	Hasse matrix and more on Hasse diagram	63
3.3.8	Approximations leading to linear ranking	67
3.3.9	Exceeding relation and net flow score	68
4.	Average Rank Methods	73
4.1	Partial Order in Time-Series Analysis	74
4.2	Subjective? No. Objective? Not Exactly	78
4.3	Partial Order Generated from Raw Data: The Mother of All Ratings	80

4.4	Data Envelopment Analysis	83
4.4.1	Efficiency: What is it?	83
4.4.2	Data envelopment analysis: Fundamentals	87
4.4.3	CCR model: Fundamental model of DEA	88
4.5	DEA and Partial Order – Rivals or Accomplices?	90
4.5.1	Discriminating power	91
4.5.2	Tiers or levels or tiers and levels?	92
4.5.3	The concomitance of DEA and partial order	98
4.5.4	Getting partial order from DEA and vice versa	105
5.	Modelling Elements: First Patterns	107
5.1	Number of Degrees of Freedom	107
5.1.1	About the correctness of models	112
5.1.2	Hierarchy of variables	113
5.1.3	Separation of variables	114
5.1.4	Checking the model	114
5.1.5	Discrete and continuous models	115
5.1.6	Linear and non-linear models	115
5.1.7	Non-linear systems	122
5.1.8	Equilibrium points	123
5.2	Configuration Space	125
5.2.1	Virtual shifts: Number of degrees of freedom	130
5.2.2	Phase space	132
5.3	Holonomic Criteria of Systems	135
5.4	Prime Integrals and the Separation of Variables	137
5.5	Multiple Regression	138
5.6	Perturbation Theory	146
5.7	Reducing the Number of Degrees of Freedom	147
5.7.1	The beginnings of solvable systems	155
5.7.2	Approximations and the Taylor series	156
5.7.3	Averaging methods	157
5.8	Other Examples	159
5.9	Stability When Changing Parameters	160
5.10	Finite Element Method	164
5.11	Building Information Modelling	164

6.	Econometric and Economic Models	165
6.1	Estimation of Unknown Parameters	167
6.2	Econometric Model	168
6.2.1	Modelling dependencies of quantitative variables	172
6.3	Stability and Bifurcations: Economic Models	173
6.3.1	Equilibrium	175
6.4	Simplified Demand and Supply Models	176
6.4.1	Basic cobweb model	176
6.4.2	Simple demand-and-supply model	178
6.4.3	Stabilisation of equilibrium prices: Non-linear case	183
6.4.4	Price vs. inventory weight factor	188
6.4.5	Stability domain for adaptive price expectations	193
6.5	Extrapolative and Regressive Price Expectations	200
6.5.1	Fundamentalist/chartist model	200
6.6	Inventories Affecting Equilibrium	204
6.6.1	Inventory from more periods	210
6.6.2	Prices from two periods	214
7.	Mathematical Modelling of a Coronavirus	215
7.1	1-i AIR Model	215
7.2	Models SIR-1 and A-SIR	217
7.3	Scheme SEIR I	222
7.4	Scheme SEIR II	223
7.5	SIRD Model	224
7.6	SEIAQHRM Model	225
8.	Facts about Population Growth and Mathematical Models	231
8.1	Population Growth Mathematical Models	231
8.1.1	Unlimited growth	231
8.1.2	Natural equilibrium	233
8.1.3	Limited growth	233
8.1.4	Logistic model	235
8.2	Interpretation of Parameters of the Logistic Model	236
8.2.1	Age structure dependencies	237

8.2.2	Competition	238
8.2.3	A predator and prey model	238
8.2.4	Complex aspects of the basic logistic equation	239
8.2.5	Normal population growth	240
8.2.6	Multiple stable values	241
8.2.7	Chaos	242
8.2.8	Boom-and-bust curve	243
8.2.9	General growth rate equation	244
8.3	Complexity of Mathematical Models	244
8.4	Calculation of Squirrels' Birth Rate	245
9.	Modelling Errors	249
9.1	Psychological Barriers and Inertia of Thinking	249
9.2	Lack of Knowledge	250
9.2.1	Kepler's model of the solar system	250
9.2.2	Tacoma Bridge	252
9.2.3	<i>Vasa</i> ship	254
10.	Principle of Comparison in Stability Theory	259
10.1	Introduction	259
10.2	Preliminaries	260
10.3	Principle of Comparison with the Scalar Lyapunov Function	262
10.4	Principle of Comparison with the Lyapunov Vector Function	266
10.5	Problems of Using Lyapunov Vector Functions	270
11.	Stability Analysis of Nonlinear Systems via Matrix-Valued Functions	273
11.1	Why Do We Need Lyapunov Matrix-Valued Functions?	273
11.2	Matrix-Valued Function for an Autonomous System	274
11.2.1	General theorems on stability and instability	275
11.2.2	Stability and instability of a large-scale system	277

11.3	Matrix-Valued Function for Non-Autonomous Systems	282
11.3.1	Decomposition of the system (10.1) of the first level	285
11.3.2	Decomposition of the second level of subsystem (11.16)	290
11.4	General Problem of Poly-Stability of Motion	296
11.4.1	General theorems on poly-stability of motion	297
11.4.2	Exponential poly-stability of separating motions	301
11.4.3	Matrix-valued functions in metric space	305
12.	Stability of Singularly Perturbed Systems via Matrix-Valued Functions	309
12.1	Matrix-Valued Function for Singularly Perturbed Systems	309
12.1.1	Singularly perturbed system: Case A	309
12.1.2	Singularly perturbed system: Case B	314
12.2	Stability Analysis of Linear Autonomous Systems	315
12.3	Stability of Large-Scale Singularly Perturbed Systems	319
12.3.1	General assumptions	320
12.3.2	Stability of the LSSPS on a non-uniform timescale	323
12.3.3	Stability analysis on a uniform timescale	326
13.	Stability of Stochastic Systems via Matrix-Valued Functions Method	331
13.1	Concept of Stability of a Stochastic System	331
13.2	Preliminaries	331
13.3	Equations of Perturbed Motion of a Stochastic System	332
13.4	The Concept of Stability of a Stochastic System	333
13.5	Matrix-Valued Lyapunov Functions for Stochastic Systems	334
13.5.1	Averaged derivative of Lyapunov function	336
13.6	Conditions for Stability in Probability	339

13.7	Conditions of Motion Stability in Mean Square Values	341
13.8	Stability of Large-Scale Stochastic Systems	344
13.9	Stability of Stochastic Singularly Perturbed Systems	347
14.	Stability in Models of Real-World Phenomena	349
14.1	Stability of an Orbital Astronomical Observatory	349
14.2	Stability of a Large-Scale Power System	355
14.3	Vibrations and Stability of Some Electro-Mechanical Systems	359
14.3.1	Oscillations in a three-mass system	359
14.3.2	Region of asymptotic stability in a 3-machine power system	360
14.4	Stability in an Autonomous Large-Scale System	362
14.5	Stability in the Lurie–Postnikov System	364
14.6	Concluding Remarks	365
