Preface	5
Introduction	7
1 The current state of knowledge of the effect of magnetic fields on fluids	13
1.1 Properties of the magnetic field	13
1.2 Magnetohydrodynamics in metallurgy and technological processes	14
1.3 Experimental study	15
1.4 Theoretical study	19
1.5 The knowledge of the numerical simulations	20
1.6 Material properties which influence the magnetohydrodynamic processes . .	23
2 Mathematical model	27
2.1 Definition of important dimensionless parameters	28
2.2 Mathematical model of an incompressible fluid flow	30
2.3 A general description of the mathematical model for the effects of the magnetic field	33
2.4 Basic equations and formulas for small values of magnetic Reynolds numbers	35
2.5 Brief description of the mathematical model in the case of a rotating magnetic field	37
2.6 The definition of Lorentz forces	39

2.6.1	The mathematical model of the translation magnetic field	43
2.6.2	The validity of the mathematical model TMF	46
2.7	The simulation of the turbulent flow	47
2.8	RANS models	48
2.9	Hybrid models of the DES type	52
2.10	Finite element method	55
2.10.1	Open boundary type conditions	60
3	Computational software	63
3.1	History of the development of the computational program	63
3.2	The motivation to programme NS-FEM3D	65
3.3	The parallel computation	66
3.4	The verification of the NS-FEM3D program	69
3.4.1	Poiseuille flow	70
3.4.2	The flow in the cavity	72
3.4.3	The rotational magnetic field in a vessel of infinite height	74
3.5	The structure of the computational code NS-FEM3D	76
3.6	Post-processing – identification of the structures	86
3.7	Start of the computational program	97
4	The rotating magnetic field - DNS calculations	103
4.1	Subcritical flow regime - an axially symmetrical vessel	103
4.1.1	Magnetic Taylor number influence on the secondary flow	104
4.1.2	Characteristic properties of the flow	105
4.2	Supercritical flow regime - an axially symmetrical vessel	106
4.2.1	The instantaneous velocity field	110
4.2.2	The time-averaged velocity field	112

4.2.3	The spectra	116
4.2.4	The vortex structures	120
4.2.5	The vortex structures and the instantaneous velocity field	125
4.2.6	Characteristic properties of the flow	127
4.3	The axially asymmetric vessel	129
5	The rotating magnetic field - turbulent models	130
5.1	The application of the turbulent models in magnetically driven flows	130
5.1.1	The definition of the dimensionless parameters	131
5.1.2	The computational mesh	132
5.1.3	The time-averaged velocity field	132
5.1.4	Reynolds stress	137
5.1.5	The turbulent kinetic energy	140
5.2	The axisymmetric vessel	142
5.2.1	The velocity field	142
5.2.2	The properties of the turbulent flow	147
6	The translational magnetic field - laminar flow regime	152
6.1	The results of the flow-induced TMF numerical simulation	152
7	The linear and nonlinear instabilities in the flow	157
7.1	The theory of linear instabilities	158
7.2	Current knowledge and publications	161
7.3	The numerical test of linear instabilities description	162
7.4	The flow induced by the rotating magnetic field	164
7.4.1	The container size $Z=1$	165
7.5	The flow induced by the translational magnetic field effect	168
7.5.1	Vessel size $Z=1$	168
7.5.2	Vessel size $Z=0.5$	173
7.5.3	The mesh density test	174

8 Comparing simulation results with experiments and theories	178
8.1 The validation of the results	179
8.2 Validation based on Davidson's theory	182
8.3 Validation in the centre of the flow rotation	184
8.4 Validation versus commercial software	185
8.5 Validation of the numerical results with the experiment	187
Conclusion	189
References	191
Index	198
