

CONTENTS

INTRODUCTION	xi
PART I. THE TECHNIQUES USED	
CHAPTER I. CLASSIFICATION OF TECHNIQUES	1
1. Rapid events. Extended or localized movement	1
2. Fundamental factors	4
2.1. Picture-repetition rate (R)	5
2.2. Individual picture exposure time (t)	7
3. Methods of recording a rapid succession of pictures.	13
3.1. Intermittent film movement cameras ($R = 240$)	13
3.2. Continuous film movement cameras ($R = 2,400$)	14
3.3. Film drum cameras ($R = 24,000$)	14
3.4. Stationary film. Multiple spark methods ($R = 240,000$)	15
4. Single flash direct-lit pictures	16
5. Spark and Schlieren photography	17
CHAPTER II. INTERMEDIATE RATE CAMERAS	
1. General considerations	19
1.1. Dependence of R on film transport speed	19
1.2. Picture size	20
1.3. Exposure time	21
1.4. Picture quality	21
1.5. Characterization of different camera types	23
2. Intermittent film movement cameras	24
2.1. General features	24
2.2. Some examples of types	24
2.3. A research application	25
3. Continuous film movement cameras	26
3.1. General features	26
3.2. Some examples	28
3.3. A research application	32
4. Stroboscopic methods	32
4.1. Moving film cameras	33
4.2. Light flashing combined with optical stabilization of film images	35
CHAPTER III. LIGHTING THE EVENT	
1. Characteristics required from the source	38
1.1. General	38
1.2. Luminous efficiency, spectral distribution, life, utilization	40
1.3. Dynamic output characteristics	41

2. Continuous light sources	42
2.1. Tungsten lamps	42
2.2. Mercury arc sources	44
2.3. Utilization considerations	46
3. Single-flash sources—millisecond region. Flash bulbs	47
4. Single-flash sources—microsecond region. Gas-discharge tubes	49
4.1. Characteristics of different types	50
4.2. Microsecond exposure times	51
4.3. Utilization considerations	52
5. Intermittent flash-discharge sources	52
5.1. Development of the stroboscopic source	52
5.2. Utilization of this source with cameras	54
6. Pyrotechnic flashes	54

CHAPTER IV. CHOICE OF SENSITIVE MATERIAL

1. Definition of terms	56
1.1. Transparency, density, exposure	56
1.2. Characteristic curve of a negative material	56
1.3. Speed criterion	58
1.4. Reciprocity law failure	59
2. Relevant characteristics of the light source	59
2.1. Static spectrograms	59
2.2. Dynamic spectrograms	60
2.3. Integrated light output	60
3. Sensitometric study of flash tubes	61
3.1. Practical significance	61
3.2. Measurement of characteristic curves	61
4. The 'photographic effect-time' curve	64
4.1. Relation to the light-time curve	64
4.2. Measurement	64
4.3. Behaviour of different emulsions	70
5. Influence on 'photographic effect-time' curve of electrical characteristics of the discharge	71
6. Guide factors	73

CHAPTER V. SINGLE PICTURES

1. Potentialities of the method	74
2. Synchronization of the illumination with the event	75
2.1. Instigation circuits for a single picture	75
2.2. Extension of technique for a limited number of single pictures	76

CONTENTS

ix

3.	Use of electro-optical shutters	77
3.1.	Use as a camera shutter	78
3.2.	Combined with microsecond region flash discharges	78

CHAPTER VI. FILM DRUM CAMERAS

1.	Principles	80
1.1.	General	80
1.2.	Film-transport rate	81
1.3.	Frame division	82
1.4.	Area of picture recorded per second	84
2.	Chronographs. Discrete images not formed	85
2.1.	Moving film types	85
2.2.	Moving optical parts	88
3.	Drum cameras. Discrete images formed	89
3.1.	Moving film types	89
3.2.	Moving optical parts	95
4.	High rotational speeds and the future	102

CHAPTER VII. SPARK AND SCHLIEREN PHOTOGRAPHY

1.	The value and characteristics of the spark source	105
2.	The direct shadow method	107
2.1.	Historical notes	107
2.2.	Interpretation of the pictures	108
3.	Schlieren methods	109
3.1.	Principles	109
3.2.	Experimental arrangements	111
3.3.	Interpretation of results	113
4.	Schlieren methods using continuous sources.	113
5.	Multiple spark-gap methods. Stationary plates	114
6.	Repetition flashing of a single spark gap	116
7.	Recent developments	118

PART II. THE APPLICATION OF THE TECHNIQUES

CHAPTER VIII. ZOOLOGICAL STUDIES

1.	Motion of animals	121
2.	Insect movements	122
3.	Bird photography	123
4.	Cine-photography in the ocean	124

CHAPTER IX. BIOLOGICAL AND MEDICAL SCIENCES

1.	The possibilities	127
2.	Cine-photo-micrography in biology	127
3.	Cine-radiography	128
4.	Single-flash work	129
5.	Miscellaneous	130

CHAPTER X. PHYSICAL AND ENGINEERING RESEARCH

1. Properties of matter studies	131
2. Fracture investigations	134
2.1. Metals	134
2.2. Glass and ceramics	135
3. Electrical discharge phenomena	136
3.1. Arcs	136
3.2. High-voltage spark discharges	137
3.3. Lightning	138
4. Flame research and combustion studies	138
5. Sprays and jets	140
6. Aerodynamic flow studies	141
7. Motion-study of machinery and machine tools	141
8. Cavitation phenomena	143

CHAPTER XI. MILITARY APPLICATIONS

1. Projectile studies in air	146
2. Underwater weapons	148
3. Explosions in air	150
4. Underwater explosions	151

CHAPTER XII. CONCLUSION 155

BIBLIOGRAPHY 159
