

CONTENTS

I. WAVE AND RAY ABERRATIONS	1
Introduction. Wave propagation. Geometrical optics. Wave-front aberration. Choice of focus. Balancing of residual aberration terms.	
II. COMPUTATION OF WAVE-FRONT ABERRATIONS	21
Formulae relating the ray and wave-front aberrations. Calculation of W for an axial image. Calculation of W for an extra-axial image (meridian plane). Calculation of W for an extra-axial image (skew plane). Optical path lengths along neighbouring rays. Chromatic aberration. Chromatic aberration of a thin lens.	
III. THE SINE CONDITION AND HERSCHEL'S CONDITION	35
Transverse and longitudinal magnifications. The sine condition. Herschel's condition.	
IV. GENERAL THEORY OF ABERRATION TYPES	48
Expansion of the aberration function. The Seidel aberrations. The first-order sagittal and tangential aberrations. The sine condition aberration terms. Classification of aberration types.	
V. ASTIGMATISM	56
Aberration due to one refraction. Equations of refraction of limitingly small pencils. Transformation of the formulae for oblique refraction.	
VI. FIRST-ORDER ABERRATIONS CONSEQUENT UPON NORMAL AND OBLIQUE REFRACTION	66
Aberration due to refraction at normal incidence. Sagittal aberration due to refraction at oblique incidence. Tangential aberration due to refraction at oblique incidence.	
VII. THEORY OF THE SEIDEL FIRST-ORDER ABERRATIONS	76
Refraction at a spherical interface. Sagittal image curvature. The Petzval surface. Distortion of the image. Summary of the Seidel aberration terms; their geometrical significance. A difference formula for the paraxial principal ray. The distortion coefficient, S_V , when A is small.	

VIII. THE COMPUTATION OF THE FIRST-ORDER ABERRATIONS	96
First-order aberrations of single and cemented components. The changes in the first-order aberrations due to a change in stop position. Certain first-order aberrations of thin lenses which are independent of the lens shape. Bending a component of an optical system. Changing a lens thickness or a separation. Transferring power between two surfaces. Changing the glass type of a component.	
IX. SOME GENERAL PROPERTIES OF THE ABERRATIONS OF SINGLE LENSES AND LENS SYSTEMS	119
Spherical aberration of a thin lens considered as a function of its shape. Central coma. Aberration-free lenses and surfaces. The aberrations of a system considered as a function of the diaphragm position. Systems of separated thin lenses. The first-order aberrations of a plane-parallel plate.	
X. THE TOTAL ABERRATION AT A SURFACE	142
Choice of reference sphere. Formulae for the total aberration. The first-order terms of the total aberration.	
XI. ASPHERIC AND REFLECTING SURFACES	149
Aberration at a figured spherical surface. First-order aberrations of aspheric systems. Aberration at a reflecting surface.	
APPENDIXES	
I. Ray-tracing formulae	159
II. The theory of pupils. Vignetting. Field Lenses	165
III. Tables of certain functions of μ	168
INDEX	169
