Preface

ix

1	Transition toward sustainable energy: approaches in modeling and optimization	1
1.1	Introduction	1
1.2	Modeling energy systems	2
1.3	Challenges to sustainable energy	4
1.4	Flexibility of energy systems	4
1.5	Conclusions	7
	References	8
2	Framework for sustainable and equitable integrated fuel production planning	15
2.1	Introduction	15
2.2	Problem statement	17
2.3	Model formulation	19
2.4	Results	34
2.5	Conclusions	38
	Nomenclature	39
	References	46
3	Strategic planning for electricity demand: balancing economics, emissions, and water use	51
3.1	Introduction	51
3.2	Methodology	52
3.3	Mathematical formulation	53
3.4	Case study	57
3.5	Results	58
3.6	Conclusions	64
	Nomenclature	65
	References	67
4	Designing an optimal waste energy integration system between plants	71
4.1	Introduction	71
4.2	Problem statement	75
4.3	Implemented model formulation	76

4.4	Results	87
4.5	Conclusions	102
	Nomenclature	103
	References	109
5	Considering the water-energy nexus in sustainable energy transitions: a multiobjective optimization approach	117
5.1	Introduction	117
5.2	Problem statement	119
5.3	Model formulation	119
5.4	Description of the addressed case study and used parameters	127
5.5	Results and discussion	134
5.6	Conclusions	150
	Nomenclature	150
	Used parameters	152
	References	153
6	Equitable profit distribution in waste heat integration across plants via a hybrid methodology	159
6.1	Introduction	159
6.2	Problem statement	162
6.3	Methodology	164
6.4	Solution procedure	164
6.5	Metaheuristic model	165
6.6	Deterministic model	170
6.7	Case study	183
6.8	Results and discussion	185
6.9	Conclusions	197
	References	198
7	Planning for long-term energy transition: incorporating battery degradation and replacement strategies	203
7.1	Introduction	203
7.2	Problem statement for the problem addressed	206
7.3	Optimization modeling	207
7.4	Mathematical optimization framework	209
7.5	Case study addressed	221
7.6	Results for the problem addressed	221
7.7	Concluding remarks	228
	References	229
8	Case study on multiobjective optimization of cogeneration systems: economic, environmental, and social perspectives	235
8.1	Introduction	235
8.2	Problem statement	237

8.3	Implemented design approach	238
8.4	Case study	247
8.5	Conclusions	253
	Nomenclature	254
	References	255
9	Optimal integration of solar thermal systems with process cogeneration	259
9.1	Introduction	259
9.2	Problem statement	260
9.3	Optimization approach	262
9.4	Case study	266
9.5	Conclusions	275
	Nomenclature	275
	References	277
10	Incorporating renewable energy storage and hydrogen production into the electrical sector	281
10.1	Introduction	281
10.2	Problem statement	283
10.3	Mathematical formulation	283
10.4	Case study addressed in this chapter	293
10.5	Analysis and interpretation of results	296
10.6	Conclusions	303
	Nomenclature	304
	References	307
11	Predictive planning for power sector expansion in Mexico with deep learning	313
11.1	Introduction	313
11.2	Problem statement	317
11.3	Methodology	317
11.4	Mathematical framework	321
11.5	Analysis and interpretation of results	326
11.6	Conclusions	345
	Nomenclature	346
	References	348
12	A stakeholder-driven approach to optimal sustainable energy system planning	355
12.1	Introduction	355
12.2	Problem statement	358
12.3	Model formulation	360

12.4	Case study	368
12.5	Obtained results	369
12.6	Conclusions	379
	Nomenclature	380
	References	385

Index **389**

389	Index	
390	1. Introduction	
391	1.1. Introduction	
392	1.2. Problem statement	
393	1.3. Optimization approach	
394	1.4. Case study	
395	1.5. Conclusions	
396	1.6. Nomenclature	
397	1.7. References	
398	2. Incorporating renewable energy and hydro power generation into the electrical sector	
399	2.1. Introduction	
400	2.2. Problem statement	
401	2.3. Mathematical formulation	
402	2.4. Case study addressed in this chapter	
403	2.5. Analysis and interpretation of results	
404	2.6. Conclusions	
405	2.7. Nomenclature	
406	2.8. References	
407	3. Predictive planning for power sector expansion in distribution with deep learning	
408	3.1. Introduction	
409	3.2. Problem statement	
410	3.3. Methodology	
411	3.4. Mathematical framework	
412	3.5. Analysis and interpretation of results	
413	3.6. Conclusions	
414	3.7. Nomenclature	
415	3.8. References	
416	4. A stakeholder-driven approach to optimal sustainable energy system planning	
417	4.1. Introduction
